The company has agreed to a definite progressive scheme for placing wires underground within the business section of the city. This will greatly improve the appearance of the city, removing many unsightly poles and the overhead network of wires. This is regarded by the technical men in the company's employ as an immense advantage to the city. It involves the expenditure of a large sum of money, and only by such agreement could this advantage be obtained.

The agreement specifically provides for certain extensions of seven lines. The list of extensions is subject to such changes as may be mutually agreed upon, the whole program to be completed within three years. As to future extensions, the company agrees to carry them out upon receipt of proper notice from the city engineer.

Subject to the rights of the municipalities affected, the company has agreed to sell to the city, in the event of the city purchasing the company's system in 1937, its property and franchise rights in the municipalities adjacent to the city, if the city should so want them. This will enable the city to deal with the transportation question of Greater Winnipeg as a whole in 1937 if it should so desire, the purchase price to be fixed on the valuation of only the physical property.

The agreement provides that in default of the company carrying out the major provisions of the contract, the city can declare the franchise of the company at an end and purchase the system, or the city may have a representative appointed to remedy the then existing default at the expense of the company. Other penalties are provided in case the company should default in carrying out the minor provisions of the contract.

MODERN EQUIPMENT PROMISED

By the agreement, the city is given more supervision over maintenance and repair of rails, roadbed, etc., and has it within its power to see to it that any renewal or new construction is of the most modern design. The agreement provides that the existing track and roadbed shall always be capable of carrying the most modern rolling stock.

The object of this provision is that the system will be kept in such condition that in the event of the city taking it over in 1937 it will not be necessary to spend abnormal sums of money in rehabilitation or in modernizing the track and roadbed of the company.

Definite responsibility in the matter of electrolysis is placed on the company, and the latter is to pay to the city immediately $35,868 for damages to underground structures alleged to be due to electrolysis. The company is to pay for all future damage within sixty days of its being ascertained.

The company is to continue to take necessary steps to eliminate electrolysis, and to obtain the results provided for in the recommendations of Professor Ganz.

The company agrees to bear a share of the cost of building any subways through which car lines will be laid.

These are the main considerations in the franchise agreement. The issue in Winnipeg has been referred to previously in the *Electric Railway Journal.*

Must Show Authority for Operation

Application for permission to file a petition in quo warranto to compel the Dayton & Western Traction Company to show by what warrant of authority it is maintaining its right-of-way through the village of New Lebanon, Ohio, was made in the Court of Appeals in Dayton, Ohio, on Nov. 18, by Prosecuting Attorney Haveth E. Mau. The action was brought in the name of the State of Ohio at the instigation of John Hinkle, member of the board of trustees of New Lebanon.

The franchise by which the traction company was permitted to operate its cars through the village expired March 22, 1922. Valentine Winters, Dayton, president of the road, negotiated with the village officials for a new franchise, to which the village would not agree unless Winters promised to lower the company's tracks in New Lebanon and to pave between them. This the company declined to do and was refused a franchise.

The company then announced its intention of building a track around the village, but this was never done and the cars have continued to operate through New Lebanon.

The petition which the prosecutor requests he be permitted to file demands that the company be ousted from the village unless it can show authority for its use of the streets.

While the company was negotiating with the New Lebanon officials, county commissioners granted the road a fifty-year franchise to operate in the county outside the municipalities.

Lost Articles Would Provide Many Comforts

In the annual report of the Liverpool Corporation Tramways the number of articles left on the cars or lost property totalled 28,970 articles during 1921, compared with 28,342 in 1920, or an increase of 628. The lost property included practically everything the human mind could think of and anything the human frame could be devoid of. There were three typewriters, two sewing machines, one skeleton (human), seven crutches and 1,445 knives, keys and locks. Unlucky "13" appeared in the role of false teeth against twelve the year before. The number of live birds and animals was decreased from eighteen in 1920 to five in 1921. The number of unclaimed articles was 8,911. The loose cash and cash found in purses amounted to £989.

Transit Work May Stop

Mayor of Cincinnati Requests Cessation of Work on Loop—Commission Disapproves and Has Authority to Proceed

The present financial condition of Cincinnati and the views of the voters as expressed at the late election demand that work be stopped on the rapid transit loop. This bombshell was exploded by Mayor George P. Carrel of that city at a called meeting of the Rapid Transit Commission on Nov. 17. There were present the heads of all the city departments and members of the Rapid Transit Commission.

Mayor Carrel said that the additional $500,000 bond issue seemed to be contrary to the present policy of the city to retrench in its expenditures within the limits the voters asked for at the last election. He asked to defer further work on the rapid transit system until a time when the city was in better finances.

The Rapid Transit Commissioners recently authorized an issue of $500,000 for further work on the subway. Most of this money was to be used in purchasing property from St. Bernard to Oakley to allow continuance of the subway system.

The Cincinnati Sinking Fund agreed to take the bonds and the money is ready to be turned over to the Rapid Transit Commission as soon as Mayor Carrel signs the bonds as required by law.

COMMISSIONERS DISAGREE WITH MAYOR

The commissioners could not see the matter in the same light as the city officials and there followed the voicing of a considerable difference of opinion. The conference ended without decision, the commissioners agreeing to compile figures showing that the completion of the system was necessary and that the interest charges on the increased sinking fund would not embarrass the city's finances.

When the commissioners protested against the Mayor's request, Charles Hornberger, Director of Public Service, presented the city's views and said that the vote at the last election against the extra city tax levy involving increased city expenditures indicated the opinion of the people against anything but strict economy.

The Rapid Transit Commission has the authority under the city charter to proceed with the work regardless of the intervention of city officials. Approximately $4,000,000 has been spent on the rapid transit system since work was begun in 1919. Two miles of the subway proper have been constructed and 4 miles of surface track are now under construction.

There are several thousand dollars left in the Rapid Transit Commission's coffers. If it is decided to comply with the Mayor's request it is probable that the loop will be continued to the Spring Grove Cemetery, at which point the Ohio Traction Company, Dayton division, will be invited to operate its cars into the city. This can be done with the money now on hand regardless of the $300,000 bond issue.

The proposed interurban line from Indianapolis to Cincinnati, of which the Connersville - Cincinnati stretch remains to be completed, is expected to run into the loop system over the Ohio Traction line and will augment the rolling-stock.

The interest on the money borrowed by the Rapid Transit Commission is not paid by the city, but comes out of an extra .50 mills tax specified by the 1916 law, which is placed on the tax duplicate every year, yields about $380,000 and goes to pay interest charges. The annual interest on the $4,000,000 worth of bonds now issued—the money used in construction work—is $240,000. The interest rate on the new $500,000 issue is 5¾ per cent.

Under the powers of the law that created the Rapid Transit Commission the commission has the right to order Mayor Carrel to sign the bonds and bring a mandamus suit against him to compel his signature.

Paving Charge Rescinded in New Franchise

The city of Belleville, Ill., granted on Nov. 20 a twenty-year franchise to the East St. Louis & Suburban Railway. This company has been operating without a franchise in Belleville since Sept. 1, 1919, on which date the old franchise expired.

When the franchise first expired the city authorities seriously discussed bringing injunction, or seeking by other means to prevent the company operating without a franchise, but upon further deliberation decided that the city needed the railway service to continue even if agreement could not be reached regarding the franchise.

At the time the franchise expired the city asked to have many extensions built and also asked the company to agree in a new franchise to many things which the company felt it could not afford. The company also took the ground that the franchise should relieve the car riders of unjust burdens such as paving.

The franchise as passed on Nov. 20 exempts the company from paving between the lines on the so-called city lines. It contains no set fare or service conditions, but fares and service are to be under the jurisdiction of the Illinois Commerce Commission, the courts, or other duly constituted authorities. The company agrees to make in the future only such extensions as will pay a fair rate upon the investment after operating expenses and proper depreciation have been deducted. The company makes no other promises in the franchise, but now that agreement has been arrived at with the city it is expected that the company will start at once toward improving track conditions which it has been unwilling to do in the past, awaiting an agreement regarding future rights.

All during the period of negotiations there were many conferences and many discussions, but no friction.

City Wins Case Against Dallas Railway

The city of Highland Park, a suburb of the city of Dallas, Tex., has won its case on appeal wherein it sought to compel the Dallas (Tex.) Railway to repair its tracks on Beverley Drive so that the city could proceed with the laying of pavement on this street. Pat Edwards, attorney for Highland Park, said his municipality is prepared to fight the case all the way to the Supreme Court if necessary to compel the traction company to repair its tracks and take care of its part of the pavement on the streets where the railway company operates.

Petition for a writ of mandatory injunction against the Dallas Railway to compel it to repair its tracks was filed by the city of Highland Park in the Sixty-eighth District Court in October. Judge J. E. Gilbert, presiding, declined to issue the writ, and the case was taken on appeal to the Fifth Court of Civil Appeals at Dallas. The Appellate Court granted the mandatory injunction as prayed for, and the traction company then asked for a rehearing. This was denied.

The rails of the Dallas Railway are elevated several inches above the level of the street pavement, and the city of Highland Park seeks to compel the company to lower its track so that the pavement will be smooth.

Rentals Will Be Subject for Arbitration

Clarence J. Wilcox, the corporation counsel of Detroit, Mich., has announced that arbitration proceedings will soon be started on the question of the Detroit United Railway's rentals for the use of city tracks by interurban cars.

A month ago, the city sent a communication to the Detroit United Railway, according to Wilcox, asking that arrangements be made for starting arbitration proceedings to fix the rental rate early in November. Recently Elliot G. Stevenson, president of the Detroit United Railway, again was requested to nominate that company's arbitrator.

The delay is occasioned, according to Mr. Wilcox, by the desire of the Detroit United Railway to include in the discussion differences between the city and the company relative to supply items and car parts.

No rental moneys have been received by the city from the Detroit United Railway, the city in its monthly street railway financial statements setting up an estimated credit of $80,000 monthly. According to City Controller Steffens, this credit was arrived at by using the interurban rental figures of Toledo, which are 36 cents per car mile for motor cars and 24 cents per mile for trailers.

In Mr. Steffens' opinion, this $80,000 credit item is low, and it is his belief that a board of arbitration will fix for Detroit a higher rental rate than is in vogue in Toledo.

Financial and Corporate

Opposes Sale of Municipal Line

The Board of Public Utilities of Los Angeles has encountered considerable opposition in its investigations of the merits for recommending the granting of a freight franchise to the Pacific Electric Railway over the municipal line of the city on San Pedro Street, over which line the Pacific Electric holds a franchise for operation of passenger trains only. There is particular opposition in regard to an allegation that the Pacific Electric Railway was negotiating with the city to purchase the municipal line on San Pedro Street.

The matter of the railway's application for a freight franchise was reviewed in the *Electric Railway Journal*, issue of Oct. 7.

The Los Angeles City Harbor Commission has entered the discussion and has found itself divided on the issue. The president of the Harbor Commission has offered a resolution opposing the sale of the city-owned line, while the other commissioners have disagreed with his stand. The president's resolution declared the sale of the tracks would give the Southern Pacific interests a monopoly, and would bar other railroads from the harbor. The tracks should be retained, he believed, as the start for a belt railway. The opposing commissioners declared the city was getting no revenue from the tracks and they should be sold to some one who could put them to use.

The Pacific Electric Railway has been using the line, which was built in 1913 at a cost of $250,000 to the city. It runs between Aliso and Ninth Streets on San Pedro Street. Postponement on action on the track sale matter means, the commissioners explained, that the commission would look into the question thoroughly before doing anything.

A statement was issued by D. W. Pontius, vice-president and general manager of the Pacific Electric Railway, on Nov. 14 concerning the suggested sale of the San Pedro Street line to the Pacific Electric Railway.

Mr. Pontius stated that the present operating agreement with the city is satisfactory and at no time has the railway suggested that the city sell the line to the Pacific Electric.

Public Service of New Jersey Increases Common Dividend Rate

The directors of the Public Service Corporation of New Jersey announced on Nov. 22 the declaration of a quarterly dividend of $2 a share on the common stock, placing it on an $8 annual basis. The previous quarterly payments have been $1.50, or $6 annually, the disbursement having been increased from $1 quarterly in March, 1922. The regular quarterly dividend of $2 a share also was declared on the preferred stock. All disbursements are payable Dec. 30 to stock of record Dec. 15.

Thomas N. McCarter, president of the company, stated that the directors also had voted on a voluntary reduction in the electric light and retail power rate, effective with December sales. He stated the action would result in a saving of at least $1,600,000 annually to the customers served.

Two changes were decided upon in the capitalization of the company. Mr. McCarter described them as follows:

> At present the authorized issue of preferred stock is $50,000,000 at par, carrying 8 per cent cumulative dividend, of which approximately $18,500,000 is outstanding. This stock is redeemable at 110 per cent of its par value, but as this tends to keep down the price of the issue to the redemption figure, the stockholders will be asked to waive this provision.
>
> The directors of the company also felt that there would be times hereafter when it would be practicable for the corporation to sell 7 per cent preferred stock and have therefore decided to recommend to the stockholders for approval the alteration of the company's charter so that the $50,000,000 of authorized preferred stock shall hereafter consist of $25,000,000 of 8 per cent preferred stock and $25,000,000 of 7 per cent preferred stock.

The company reported operating revenues of subsidiary companies for October, 1922, amounting to $7,025,012, an increase of $480,539 over October, 1921. The net increase in surplus before dividends was $590,693, an increase of $98,887 over October, 1921, and for the first twelve months ended Oct. 31, 1922, the net increase in surplus before dividends was $5,416,693, an increase of $2,477,619, as compared with the twelve months ended Oct. 31, 1921.

Identity of Purchasers Disclosed

F. L. Dame, Edwin Gruhl, James F. Fogarty and Robert Sealy, all connected with the North American Company, New York, N. Y., and L. E. Kilmarx and others are the principals of a syndicate which has purchased 27,500 shares of the common stock of the Washington Railway & Electric Company, Washington, D. C. As noted in the *Electric Railway Journal* for Nov. 11, the purchase was negotiated through Crane, Parris & Company, investment bankers, during the week ended Nov. 4 and created lively comment in financial circles at that time.

So far as Messrs Dame, Gruhl, Fogarty and Sealy are concerned the purchase was made by them as individuals for investment and not in the interests of the North American Company. The stock taken over had been pledged as collateral for a loan and the prices paid by Crane, Parris & Company for it, while not made public, is said to have been sufficient to pay the noteholders both principal and accrued interest on their investment.

Deficit Reported in Albany

According to the third quarterly report the United Traction Company, Albany, N. Y., suffered a net corporate loss for the period from July to September inclusive of $56,353. The loss for the corresponding period a year ago was $476,318. The net operating revenues showed a profit of $119,261 and the operating expenses advanced more than $29,600 over the same quarter in 1921.

In the third quarter this year 10,103,995 fares were collected, compared with 3,540,995 in the same 1921 quarter.

The net corporate loss to date for this year is $106,726, bringing the accumulated deficit of the company to $3,308,051. While the company has operated at a net corporate loss of $106,726 for the first nine months of this year, last year, due to the strike, its net loss for the same quarter was $2,040,442.

To date this year 32,329,507 passengers have been carried, which compares very favorably with five years ago, when a peak was reached for the first nine months with 36,122,382 passengers carried. A total of 24,284,094 more passengers were carried up to Sept. 20 this year than last year.

Order Issued on Discontinuance

Service on three branch lines of the Indiana, Columbus & Eastern Traction Company in Ohio will be discontinued at midnight on Dec. 31, 1922, under an order issued by the State Public Utilities Commission on Nov. 17. The order was issued on application of the company, which produced evidence to show that it was losing money on operations on all three of the lines. The branches on which service is to be stopped are the New Carlisle-Carlisle Junction, Columbus-Orient and Lima-Defiance branches.

Application to discontinue service on the three lines was filed more than a year ago by the company with the State Utilities Commission. The first of this year, however, the commission instructed the company to continue service on the branch lines for at least six months more, after which the commission would consider a renewal of the application should the company care to file it. In September, 1922, J. H. McClure, receiver of the company, filed a renewed application, at the same time submitting evidence to show that the three lines had been operated at a loss during 1922.

Officials of the company say that automobile ownership by suburbanites, coupled with motor bus competition, led to the loss.

Line Sold

The Maumee Valley Railways & Light Company, operating between Toledo and Perrysburg, Ohio, was sold on Nov. 15 to M. M. Miller, president of the Home Savings Bank of Toledo. The price was $50,000. The company had been in receiver's hands for more than a year.

Early Publication of New York Commission Reports Expected

When the reorganized Public Service Commission in New York State went into office in 1921, it found statistical reports in arrears for 1918, 1919 and 1920 in the first district and for 1919 and 1920 in the up-state district.

During the past year the commission up state has published the back reports and expects to have ready for distribution by the middle of January, 1923, reports covering full statistical data from all of the service corporations over which it exercises supervision and which are required to report to it, for the year 1921. Thereafter it aims to print and distribute all reports within one year after the companies file their statements with it.

It takes about a year to collect, correct and put into final form for the printer annual reports of public service corporations. Many corporations are late in filing and after the statements are filed the accounting department of the commission checks them over carefully for errors either in the manner of making out the reports or of calculations.

This early distribution of up-to-date reports will be of incalculable value to municipalities and corporations and will in many instances save a trip to Albany and exhaustive searches of records. Under the new system the accounting department after January, 1923, will be caught up with its work on reports at all times and will be able to devote a considerable amount of time to the detailed examination of the returns of corporations which they have not previously been able to do. In restoring order to these commission activities not a little credit is due to H. M. Ingram, who was appointed to the newly-created position of director of information early in 1922.

Line May Be Junked

Deed to the properties of the Springfield Terminal Railway, operating the Springfield, Troy & Piqua Railway, was passed to the Shoenthal Company of Columbus, Ohio, in the latter city by Receiver George Whysall on Nov. 17. The company recently purchased the traction properties for $87,000 with approval of the sale by the Federal District Court.

Officials of the Shoenthal Company announced that they would wait a reasonable length of time for offers from persons who might desire to operate the traction line, but that if no such offers were received within the near future, the road would be junked. The company holds the value of the line as junk to exceed $100,000.

Reports covering revenues and operating expenses of the traction line for the months of July, August and September, 1922, were filed by the receiver in Federal District Court at Cincinnati on Nov. 18. The reports disclose a deficiency of $213 for July, $89 for August and a surplus of $201 for September. The receiver reported a total deficit of $709 for the period from Jan. 1, 1922, to Sept. 30.

R. P. Stevens and Associates Purchase Williams Interest in Republic Company

Eastman, Dillon & Company, New York, N. Y.; R. P. Stevens and John T. Harrington of Youngstown, Ohio, have purchased from Harrison Williams and associates their interests in the Republic Railway & Light Company, which, through its subsidiaries, Pennsylvania-Ohio Electric and the Pennsylvania-Ohio Power & Light, owns and controls the entire electric light, power, local and interurban electric railway business in the industrial district between Pittsburgh and Cleveland. The territory served comprises about 600 square miles with a population of more than 300,000.

At a meeting on Nov. 22 Herbert L. Dillon, Henry L. Bogert, Jr., and Walter H. Nash of New York, and John T. Harrington and John R. Rowland of Youngstown were elected directors of the company to succeed Harrison Williams, R. E. Breed, F. L. Dame, Edwin Gruhl and Robert Lindsay as members of the board. No changes either in management or policy are contemplated.

Financial News Notes

Seeks Dissolution.—The Point Loma Railroad, San Diego, Calif., has made application to the Superior Court for voluntary dissolution. The property of the company has been taken over by the San Diego Electric Railway.

Amount of Accumulated Dividend Due Reduced.—The Duluth-Superior Traction Company, Duluth, Minn., has reduced the amount of accumulated dividends on its preferred stock to $3 through the declaration of a dividend of $3 on account of accumulations on that issue since the last quarterly payment of $1 on April 1, 1921. The disbursement will be made on Jan. 2 next to stockholders of Dec. 15.

Appoints Receiver for Insolvent Road.—George Raelsley, Mount Bethel, Pa., has been appointed receiver for the Bangor & Portland Traction Company, Bangor, Pa., on application for attorneys for the Easton Trust Company, trustee for the Bangor & Portland Traction Company and the Bangor Trust Company bondholders, who have a mortgage on the property of the company. In the application for a receiver it is stated that the road at the present time is insolvent.

Bonds on Sale.—A syndicate composed of Hemphill, Noyes & Company, Stroud & Company, Inc., Coffin & Burr, Inc., and Otis & Company is offering $3,000,000 of Tide Water Power Company's first lien and refunding mortgage series "A" sinking fund 6 per cent gold bonds. The bonds are offered at 96 and interest to yield 6.35 per cent. The bonds are dated Oct. 2, 1922, and are due Oct. 1, 1942. The Tide Water Power Company does all the electric light and power, gas and railway business in Wilmington, N. C., and suburbs. The company also furnishes through a subsidiary all the electric light and power in St. Petersburg and Clearwater, Fla.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population.

Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen and conductors on 105 street and interurban railways in the United States, operating more than 100 passenger cars each, and weighted according to number of cars.

Traffic and Transportation

New Chicago Bus Franchise

Commission Discusses Permanence, Financial and Operating Ability and Competition in Decision

The Illinois Commerce Commission on Nov. 21 granted to the Chicago Motor Bus Company a certificate of convenience and necessity, giving it the right to operate a bus service over certain boulevards on the south side of the city in addition to the present operation on the north side. In the course of its decision the commission said there was "involved not only the demand on the part of the public for a certain service to be rendered by a public utility but also whether or not the applicant had the experience, ability and stability to become a permanent part of the transportation service in the community involved." It was pointed out that in all public and private enterprises transportation service is one of the cogent influences involved, but that it cannot be held to be a public convenience that some inadequate or ill-advised transportation service for a particular district be authorized when it is apparent that such service would be only temporary.

SURFACE AND "L" LINES ESSENTIAL

The commission said that considerable evidence was introduced as to the inadequacy of service of the surface and elevated lines in certain portions of the South Side, but continued:

> Nevertheless the Surface Lines are an existing transportation utility and extensive development has taken place on the south side of Chicago depending upon the continued service heretofore rendered by said company. In the consideration of motor bus transportation, the commission should be cognizant of the fact that it would not be considered to be the public convenience and necessity of either the whole people of Chicago or those persons immediately depending upon the surface or elevated lines for transportation that bus lines should be instituted which would either seriously impair the service of present lines of transportation or would ultimately destroy this service entirely. The witnesses in this case were unanimous in that while they criticised the service of the surface and elevated lines severely, yet none of them desired that the car service be entirely eliminated. Mr. Richie, a witness for the Chicago Motor Bus Company, indicated by his evidence that bus service is rather a classified service supplementary to the service ordinarily rendered by street cars, and in addition affords more recreational advantages to many persons and families who might not otherwise be able to enjoy the pleasures and benefits of the park system in Chicago.

Discussing the place of the bus with respect to the entire transportation scheme in Chicago, the commission declared it must keep the institution of bus line transportation in mind but such service should be unified in the main artery in Michigan Avenue, so that ultimately there may be a through bus service from the south to the north side of the city of Chicago. The bus service should also be so distributed and controlled that it will be permanent in the communities which it shall serve and readily unified in any general transportation scheme, which ultimately may be necessary.

One of the considerations mentioned by the commission in granting the certificate to the Chicago Motor Bus Company rather than the Depot Motor Bus Lines or the Chicago Stage Company, which had made similar applications, was that the first named had drafted for its enterprise "experienced and talented managers and engineers." Special mention was made of the ability, research and experience that had been employed by this company in solving the Chicago motor bus problem.

FINANCIAL STRENGTH CONSIDERED

The Commerce Commission also took note of the relative financial strength of the three applicants and noted that the Chicago Motor Bus Company had interested sufficient capital to carry out successfully a permanent motor bus enterprise, while the Depot Motor Bus Lines was said to be lacking in ability and financial stability. Another point mentioned with respect to the Depot Motor Bus Lines was that the routes over which it had applied for the right to operate would cause it to come "in immediate competition with present transportation service to a much greater degree than those routes proposed by the Chicago Motor Bus Company."

No Telling Results of Weekly Pass Plan

In September, 1922, the Pacific Electric Railway undertook to try out a weekly pass plan for its local lines in Pomona and Riverside, Calif. The plan provided for the sale of "weekly passes" for local lines at the rate of $1 a week, the purchaser being privileged to use his pass as often as desired during the seven days period on local lines and without restriction as to individual use.

Up to Oct. 10 the results were somewhat disappointing, the number of persons in the cities named being very small who availed themselves of this privilege. At this time it was anticipated that unless the demand for the tickets became greater their sale would have to be discontinued.

On Nov. 10, after summarizing the result for the month of October, the company was unable to predict the final outcome or results, yet early indications are that revenue from this new class of service, which heretofore has been entirely insufficient to pay operating expenses on these particular car lines, may be somewhat increased.

Travel on the Riverside local lines increased 7 per cent, with approximately 2 per cent increase in revenues, while in Pomona travel increase was shown to be 15 per cent with no increase in revenue.

Transportation Issue Aroused Saginaw

Unprecedented Vote in Michigan City on Nov. 7 on Car Question—Recount Under Way

Although the franchise calling for street car-bus transportation for Saginaw failed to carry unofficially by fifteen votes, which would have given the proposition a 60 per cent majority, there is every evidence that the people of that city have awakened to the need of street cars with proper bus extensions and feeders, and are not at all satisfied with motor bus transportation which they have had exclusively since Aug. 10, 1921.

The election of Nov. 7 made history for Saginaw. With one exception, and that was the general election of 1920 when throughout the United States there was the greatest vote cast, Saginaw had its second largest election. No local proposition in the history of the city every attracted the votes the franchise did. The total vote was 10,534 for the franchise and 7,047 against. No municipal proposition was ever given the affirmative vote that the franchise received.

There has never been such an absolute opposite expression from the electors, who since 1907, when the state constitution was adopted fixing the percentages as 60-40 for all franchises and bond issues, have consistently refused to grant a contract to a public utility corporation.

These propositions have even failed to secure simple majorities. This franchise was submitted by initiatory petitions signed by 10,000 citizens, 6,000 more than required. An educational campaign was carried on in every voting precinct. Even the chronic "No" districts were converted to an extent, and friends of street cars believe that if a new measure is presented, with certain revisions from the one recently rejected, there is little question of its adoption.

At the present time the Council is conducting a recount acting on petitions of both sides in the campaign. As all members of the Council publicly opposed the franchise it is believed as a result of their rulings on certain ballots the Supreme Court will be the agency that will finally determine the result of the election.

With half of the vote canvassed, 75 "No" ballots have been counted where the electors placed a cross in the "o" of the word "No" and not in the square before the word. These ballots friends of the franchise insist are illegal, and were backed by the city attorney, but the canvassers disregarded his opinion, and it went so far that Mayor Mercer accused the city attorney of favoring an attorney for the franchise when just prior to his opinion, two "Yes" votes had been thrown out on his ruling. The city attorney resigned his post when his honesty was questioned, but since then has withdrawn his resignation, the Mayor having publicly retracted his statement.

Request for Half Fares for Oakland School Children

The city of Oakland, Calif., petitioned the Railroad Commission on Nov. 16 for an order requiring the San Francisco-Oakland Terminal Railways to establish half fares for school children in that city. The city alleges that the company has refused to grant half fare for school children as requested by the Council, although it is alleged such fares have been put in effect by the company in Richmond and Alameda. It is claimed there is no valid reason for this distinction which is asserted to be an illegal discrimination. A check made by the Board of Education of Oakland is set forth showing that 3,616 pupils use the street cars daily, 3,338 occasionally and it is estimated that if half fare rates were granted 5,800 students would use the car service. The net revenues of the company, it is declared would be increased by the granting of half fares.

Operation of One-Man Cars Within Three Months

The City Council of Augusta, Ga., has unanimously passed the amendment to Ordinance 104, whereby the Augusta-Aiken Railway & Electric Corporation will be allowed to operate one-man cars in the city without having to flag the crossings of steam railroads. Section 3 of the amendment requires the driver or operator of the one-man car to bring his car to a full stop not less than 15 ft. from the near rail of the steam railroad crossing. Further, that the operator shall not proceed with his car across the crossing until "he is fully satisfied by careful observation that no locomotive engine or engine and cars are approaching such crossing from either direction." General Manager Banghart announced some time ago that following an official notice of the Council's action he would try to have the one-man cars in the city within three months.

Service on Interurban Lines Resumed

For the first time since May 1, when its employees walked out following a lockout, the Steubenville, East Liverpool & Beaver Valley Traction Company on Nov. 21 resumed service on its interurban lines between the Pennsylvania-Ohio state line and the Pittsburgh & Lake Erie station at Beaver, Pa. The resumption of operations on this line was marked by a complete absence of disorder. The first car, operated by an imported crew, carried two members of the Pennsylvania state constabulary, General Manager C. A. Smith and other officials.

The company has established a carhouse at Industry, Pa., and the cars are being operated out of it. The company announces that everything is in standard running condition and that full provisions have been made for car repairs at the Industry carhouse.

As the first car was on its way to the state line, hundreds of pedestrians looked on, but no attempt whatever was made to impede its progress. No passengers boarded the first car. About thirty state constables were stationed at strategic points.

Outside carmen are operating the interurban cars and no positions were accepted by members of Division 52, the company's employees before the tie commenced. The majority of these former employees are operating buses in the East End, Liverpool. They will make no comment on the company's action, stating that they will remain steadfast in their policy of complete non-interference.

The situation in East Liverpool practically remains unchanged. Members of the City Council met the day the company resumed its interurban operations and discussed the situation, but declined to indicate that any action would be taken before the hearing in court on the injunction which is now pending against the traction company.

Transportation News Notes

One-Man Idea Given Up.—The Washington-Virginia Railway, Washington, D. C., has decided against the operation of one-man cars on its system between Alexandria and Washington.

Opposes Bus Application.—The Philadelphia (Pa.) Rapid Transit Company recently opposed an application made by Wilbur F. Menke for the right to operate two buses between Bridge Street, Frankford, and Byberry. Representatives of the railway said that there were ample facilities to reach the elevated line.

Cannot Grant Request.—The request of employees of the Bethlehem Steel Company that the Harrisburg (Pa.) Railways reduce its fare 1 cent has been turned down. The traction company said in its refusal that such step was impossible in view of present conditions and that it could not afford to operate on less than a 6-cent rate.

Claims Excessive Freight Rates.—The Eastern Texas Electric Company, Beaumont, Tex., has filed suit in the Eightieth District Court for $24,274 for alleged excessive freight rates for transporting oil shipments from Port Arthur to Beaumont. The claim involves 38,331,695 lb. of oil shipped in the year 1920.

Railway Hauls Sugar.—The newly electrified railroad, the Cuban Electric, plays an important part in the sugar-producing industry. It carries trains of cars loaded with sugar cane on the north Cuban coast, 30 miles east of Havana. Besides hauling cane to the mills, three-car passenger trains are run for the accommodation of the traveling public of Havana and Matanzas and intervening territory.

May Substitute Bus for Trolley.—The Northumberland County Railway, Sunbury, Pa., is considering petitioning the Public Service Commission for permission to abandon its line to Hamilton, a suburb of Sunbury, and substitute a motor bus line. The poor service conditions, which cannot be remedied because of the enormous expense that is encountered in maintaining the line, will necessitate a cessation of operation. The fare on the trolley is 7 cents.

Extends Eight-Cent Fare.—The Missouri Public Service Commission at Jefferson City, Mo., has entered an order extending the present 8-cent fare of the Kansas City (Mo.) Railways for six months from Nov. 18. No one appeared to oppose. John P. Pew, city counselor, said that the city did not oppose the granting of the extension, because it is believed that the present fare is necessary to sustain the company.

City Dictates Car Stops.—Has the city in Indiana a right to say where a street car shall stop to discharge or take on passengers? The city of East Chicago, Ind., believes it has. Recently the City Council there passed an ordinance to prevent street cars from stopping on Forsythe Avenue between the Wabash Railroad tracks and Chicago Avenues. Violation of the ordinance was made a penal offense. The police have arrested the crew of a Hammond, Whiting & East Chicago Railway car for violating the ordinance. The company will make it a test case.

More One-Man Cars in Milwaukee.—The Railroad Commission of Wisconsin has permitted the Milwaukee Northern Railway to operate one-man cars on its Milwaukee city line which runs from Fifth and Wells Streets in the heart of the business district to Twentieth Street and Atkinson Avenue on the north side. The company must make changes in its cars in accordance with plans approved by the commission for installation of safety devices. In considering a Milwaukee city ordinance of 1914 requiring two men on all street cars, the commission pointed out that it believed the ordinance to be unreasonable in so far as it applied to this particular case.

Arranging for Electric Express Business.—Arrangements have been concluded for the rapid delivery or receipt of shipments in Philadelphia sent from or to any point on the Morristown and Reading divisions of the Reading Transit & Light Company, Reading, Pa., and connecting electric railway lines. An important increase in the electric express business of the Reading Transit & Light Company is expected to follow these arrangements. Under the new arrangement shipments are accepted for or received from Front and Market Streets, Philadelphia, where a large, efficient and convenient terminal is used by the Public Service Transportation Company. The latter company and the Reading Transit & Light Company now interchange shipments at Wissahickon, and the advantages of through billing at freight rates is proving popular.

Personal Mention

Editor Will Help in Coal Investigation

The Federal Coal Commission has called upon C. E. Lesher, editor of *Coal Age*, a McGraw-Hill publication, to organize the investigation division and to direct the engineering phases of its work. He will act as a special adviser serving as a consultant on statistical and engineering problems. Production cost problems will be investigated by David L. Wing, formerly of the Federal Trade Commission and of the Department of Commerce.

The appointment of Mr. Lesher and Mr. Wing expresses the plan of the commission to put the actual work of fact finding into the hands of a few men who thoroughly understand this problem of coal which is constantly harassing industry and the householder.

The commissioners expect to obtain much of their information from the outstanding men engaged in coal production, distribution, wholesaling and retailing, but a vast amount of data must be collected by a technical staff. Direction must be given to the collection and interpretation of the facts and figures gathered, and for this work the commission has selected Mr. Lesher and Mr. Wing.

In organizing the investigation division for the commission, Mr. Lesher will have to do with (1) production (including all phases of mining coal, except the labor element); (2) transportation in its effect on the coal industry; (3) distribution of the product.

Mr. Mitten for Mayor

Thomas E. Mitten, president of the Philadelphia Rapid Transit Company, has been asked by the Republican women of Pennsylvania if he will consent to run for Mayor. The organization is headed by Mrs. George Horace Lorimer. It boasts a membership which includes virtually all women in this city prominent in Republican politics. The Philadelphia *Ledger* unfolds the story as follows:

In "hunting about for a good man to be the next Mayor," Mrs. Lorimer requested Mrs. Rudolph Blankenburg, honorary president of the organization, to ascertain Mr. Mitten's views of the matter and tell him that many persons in this city would like to see him run in the next mayoralty race. Furthermore, he was requested to say whether or not he would consent to be boomed for the office.

In reply to Mrs. Blankenburg, Mr. Mitten stated that he was too busy at this time to enter politics and that he couldn't consider the matter for some time.

"But Mr. Mitten didn't say that he wouldn't consider the matter," said Mrs. Lorimer, after learning of Mr. Mitten's reply. "The organization which I head feels it is important to place its support squarely behind a worthy candidate. We want to be ready to assist such a man. Many of us feel that Mr. Mitten could do a great deal for Philadelphia. That is why he was asked to consent to enter the race."

Iowan Heads Utility Commissioners

Dwight N. Lewis Chosen at Detroit as President of National Association of Railway and Utilities Commissioners

Dwight N. Lewis was elected president of the National Association of Railway and Utilities Commissioners at the meeting of the members of the association in Detroit during the week ended Nov. 18. A lawyer by profession, Mr. Lewis entered the employ of the commission of which he is now a member twenty-five years ago when he was the whole office force in charge of its accounting, secretarial work, rate work and reporting. He went into training as a commissioner right then and gradually advanced to secretary and later to counsel for the commission, which position he held for six years. He was then appointed to fill out an unexpired term and was elected in 1918 to a four-year term. He has just been re-elected for another four-year term by a majority of 200,000, one of the largest Republican votes ever given in that state.

D. N. LEWIS

Mr. Lewis is noted for his thorough and consistent work as an Iowa commissioner. Not only does he stand high in the estimate of Iowans, but also in the estimate of every public service commissioner in the United States. For twenty-three years he has been a member of the national association and has done an immense amount of committee work and all the other things which go to make association activities useful. The election of Mr. Lewis at Detroit to the presidency of the association for the ensuing year was one of the most popular which that association has had.

Mr. Lewis is a native Iowan. He was graduated from the Drake University Law School at Des Moines, Iowa. His ideal as a public service commissioner is so to regulate the utilities that they may be permitted to grow to serve the public adequately.

Another Railway Man Makes the Grade

Some few weeks ago it was said in these columns in recording the accomplishments of W. B. Yereance that railway men did not usually succeed in "Making the Grade" in the sense that the New York *Globe* uses the phrase. It was explained then that this was probably so because in railroad life the opportunity seldom presented itself for spectacular or quick success. And just as though it desired to prove that this is not entirely true or taking to heart the fact that it had been chided for its seeming neglect of railway men, the *Globe* in its issue of Nov. 21 nominated a railway man to its gallery of notables.

Now there are many local railroad men fairly well known to New Yorkers, but the *Globe* picked a street railway man. He was none other than Frank Hedley. As for romance and accomplishment, there are perhaps few other careers that offer such possibilities as his. Mr. Hedley comes from a family of railroaders. His great uncle had a great deal to do with perfecting the first locomotive. In fact as between William Hedley, for that was the great-uncle's name, and George Stephenson there appears to have been almost the same parallel in applying new theories that happened in the case of Darwin and Wallace in their biological discoveries.

From such surroundings did Mr. Hedley spring. The rungs of the ladder on which he climbed from machinists' helper to head of the Interborough Rapid Transit Company are too well known to railway men to be repeated now. To them his philosophy is of greater interest. In the *Globe* Mr. Hedley says: "The best way to make a living is to be able to produce; convince the other fellow that you know how to do it—then make him pay you well for it."

A. W. Thompson Elected Pennsylvania Director

Arthur W. Thompson, Pittsburgh, was elected a director of the Pennsylvania Railroad on Nov. 22 to succeed the late Thomas De Witt Cuyler. Mr. Thompson is president of the Philadelphia Company and the Pittsburgh Railways. He was vice-president in charge of operation and traffic of the Baltimore & Ohio Railroad before becoming head of the Philadelphia Company.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Does It Pay to Use Home-Made Repair Parts in Signals

The User Cannot Expect the Manufacturer to Be Responsible for Results Unless Worn Parts Are Replaced with Standard Duplicates

By Carl P. Nachod
President Nachod Signal Company, Inc., Louisville, Ky.

Manufacturers of block signals for electric railways have successively improved their designs, both by using materials of recent development (and this especially as regards insulation) and incorporating the results of experience as revealed by a close following-up of actual service conditions; as well as by embodying the ofttimes valuable suggestions of users. Thus modern equipment contains all improvements that tend to simplify operation, reduce maintenance cost and contribute to safety.

Normal Wear Very Slight

During their service electric railway signals depreciate little by normal wear, but are subject to occasional high voltages, as from lightning or other surges, which often result in the destruction of insulation. Also accidents to the signal line wires, such as grounding, or crossing with other high-voltage wires, cause roasting out and destruction of magnets and resistors, so that repairs eventually have to be made.

The subject of maintenance is fundamental and of prime importance to the railway, which should use the proper materials and most efficient system to insure economical results. Many railways carry a sufficient stock of the manufacturer's spare parts, for they realize that primarily they are operators, and not manufacturers, and have found it to their advantage to recognize such a dividing line for the general good of the industry. Railways sometimes claim that by making their own repair parts they do so at a lower cost, but it will generally be found that their accounting systems do not take into consideration the proper allocation of the overhead charges that should be made.

Home-Made Parts Costly

The ultimate cost of home-made parts is higher in most cases for at least one reason, namely, that the quality is not up to the standards of the manufacturers. They are indeed best fitted to produce reliable and interchangeable renewal parts. They have skilled and specialized workmen and trained engineering and inspection organizations to insure that only the best and most suitable materials are used, and that all important details are complied with during manufacture to produce renewal parts of first quality that go into the old location without any fitting. It is also true that when the railway makes its spare parts these are literal copies of the original design. Progressive manufacturers, on the other hand, through their research and the work of their design engineers, continually improve their product by the use of the most suitable materials, and improved and up-to-date shop equipment. These improvements are, of course, not incorporated in the home-made parts. Probably one most valuable benefit of all is forfeited in that the railway loses personal touch with the manufacturer. It consequently does not get the full co-operation and assistance from his expert service department. By using the manufacturer's parts, however, railway operators put themselves in a position to receive suggestions as to improved methods of operation, testing and location of troubles and defects. All of this results in decreased expense and improved operation.

Cases of False Economy Cited

A few cases from the writer's experience will serve to show the false economy of using home-made parts.

A brass rod on a magnet plunger broke after some eight years of service in a certain signal, and the railway replaced it with a home-made part, the dimensions of which were not sufficiently accurate. As a consequence, the signal failed intermittently, perhaps once or twice a week, and more than two weeks time on the part of an employee was required to watch the signal, catch such a failure and disconnect to find the affected parts. Not only was the good service and reputation of the signal affected adversely thereby, but the cost of the man's time to discover the trouble must have been hundreds of times the total cost of the part referred to.

In another case one of our users had replaced with Chinese copies one of the patented elements in our signal system, but the steel used in the part had not the proper temper and would not hold its shape, while the inferior insulation broke down in the presence of moisture.

Another user made some parts, simplifying them by leaving out what seemed to him useless openings, but after he had assembled these in the signal it was discovered that he had destroyed accessibility, and there was no way to reach certain assemblies in the relay unit.

The manufacturer is interested at all times to have the railway obtain the best service from his apparatus. To that end he is willing to give all available instruction not only in the form of printed manuals or by sending an expert to confer with the maintainer and to inspect the actual signals by visits in the field with him, but even in training the maintainer at the manufacturer's shops. The latter course is greatly to be recommended, and has produced remarkable results in low maintenance. The writer has found that without this training the continuous and unnecessary destruction of parts due to a wrong diagnosis of an existing trouble is considerable, and furthermore the ordering of spare parts is not intelligently done.

If the maintainer would exercise as much zeal in analyzing and recognizing the conditions that cause damage and keeping them away from his installations as he does to make his own parts a great deal would be accomplished.

Post Office Department Co-operates With Business Houses

The use of antiquated and antedated mailing lists by business concerns sending out advertising matter and circular letters is resulting in serious economic waste, the Post Office Department averred recently.

Besides the delays undergone by the postal machinery in handling and re-handling vast quantities of this class of mail, which is incorrectly addressed in most instances, the loss suffered by the mail order houses and other large users of mail runs into thousands of dollars annually.

In an effort to put an end to this tremendous waste of energy and time instructions were issued to postmasters throughout the country to co-operate with business concerns in correcting and revising their mailing lists. A charge of 60 cents an hour may be made for this service, according to the order issued by Postmaster-General Work.

Metal, Coal and Material Prices

	Nov. 21, 1922
Metals—New York	
Copper, electrolytic, cents per lb	13.90
Copper wire base, cents per lb	15.625
Lead, cents per lb	7.10
Zinc, cents per lb	7.50
Tin, Straits, cents per lb	36.625
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$8 00
Somerset mine run, Boston, net tons	4.125
Pittsburgh mine run, Pittsburgh, net tons	3.37
Franklin, Ill., screenings, Chicago, net tons	2.625
Central, Ill., screenings, Chicago, net tons	1.87
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	6.50
Weatherproof wire base, N.Y., cents per lb.	16 00
Cement, Chicago net prices, without bags	$2 20
Linseed oil (5-bbl. lots), N.Y., cents per gal.	90 00
White lead, (100-lb. keg), N.Y., cents per lb.	12 125
Turpentine, (bbl. lots), N.Y., per gal.	$1.59

Rolling Stock

Elmira Water, Light & Railroad Company, Elmira, N. Y., is placing an order for four new safety cars similar to the eighteen now in use on the lines in Elmira.

St. Petersburg, Fla.—Voters of St. Petersburg will decide on Dec. 5 whether they approve a bond issuance of $30,000 for the purchase of cars for the local municipal railway.

New York & Queens County Railroad, New York, N. Y., suffered the loss of three trolley cars and a tower repair wagon in a recent fire at the Woodside carhouse. The loss was estimated at $10,000, all covered by insurance.

New York, New Haven & Hartford Railroad, New York, N. Y., has increased its contract for five electric locomotives with the Westinghouse Electric & Manufacturing Company until a total of twelve locomotives are now covered by the contract. When the twelve new locomotives are put into service there will be 117 Baldwin Westinghouse freight, passenger and switcher type locomotives in operation on this road. The original order was referred to in the *Electric Railway Journal*, issue of Oct. 14.

Track and Roadway

Savannah Electric & Power Company, Savannah, Ga., will soon start work on constructing the track and necessary overhead equipment south on Ott Street from Anderson to Thirty-fourth and thence on Thirty-fourth Street to the present line on Waters Road.

Capital Traction Company, Washington, D. C., has started work on its extension over the new Georgetown bridge. The job will not be completed before spring and will cost $160,000. This extension will make possible the first through car route from Rosslyn, Va., to Washington.

Boise Valley Traction Company, Boise, Idaho, has completed the new belt line. Two blocks of track have been laid on Brumback Street between Eighth and Tenth Streets. The light rail on Ridenbaugh Street, over which the Boise Street Car Company will route its cars, has been replaced by heavier stock taken up from Tenth Street.

Southern Pacific Company, San Francisco, Calif., has received permission from the Railroad Commission to construct a track at grade across east Twenty-fifth Street and across Alameda Street and to relocate two of its tracks at grade across East Twenty-fifth Street in the city of Vernon. The company was also granted permission to construct a spur track at grade across Beck Street in Oakland.

New York, N. Y.—The Transit Commission has awarded the contract for constructing the column foundation for part of the Flushing extension of the Corona branch of the Queensboro Subway to the Gustin-Morris Contracting Corporation of Long Island City. Its bid of $91,613 was the lowest. The commission also announced the awarding of a contract for concreting voids under the platform of the Eighth Street station of the Broadway subway, New York, to Edwards & Flood, Inc., lowest bidders, at $1,236.

Power Houses, Shops and Buildings

Savannah Electric & Power Company, Savannah, Ga., has begun work on the repairing and reinforcing of the bulkhead and wharf at the Riverside power station. The contract for this work was awarded to David Power, contractor.

Union Traction Company of Indiana, Anderson, Ind., has announced that it will enlarge its central power plant at Anderson to provide sufficient power to operate all its electric car lines, of about 460 miles. Additional high-tension feed lines will carry power to substations at Muncie, Union City, Bluffton, Peru, Indianapolis, Logansport, Wabash, Warsaw, Newcastle and smaller towns.

New York, New Haven & Hartford Railroad, New York, N. Y., will install a new turbine-generator in its Cos Cob station, to take care of an increased load due to the placing in service of twelve new high-speed passenger locomotives. Both the locomotives and the turbine-generator are being constructed by the Westinghouse Electric & Manufacturing Company. The new turbine-generator is a 9,000-kw., single-phase, 25-cycle unit. The turbine is designed to carry 12,500 kw. and the generator to take these peaks for a period of five minutes. In the order received by the Westinghouse Company for this apparatus is also included switching equipment for control of the turbine-generator exciter.

Trade Notes

American Mason Safety Tread Company, New York, N. Y., announces that J. W. Scott, formerly sales manager of its New York office, has severed his connection with the company. The management of the office is now under the direction of A. T. Dulfer.

Nic Le Grand, Inc., Rock Island, Ill., announces that it is the representative of the Burry Railway Supply Company for Hartman ball bearing center plates and roller side bearings. Nic Le Grand covers the states of Kentucky, Indiana, Illinois, Wisconsin, Michigan, Missouri, Iowa and Nebraska.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., will supply the West Penn Power Company with two 30,000-kw. turbo-generators with surface condensers for installation in its Springdale plant. It is expected that the equipment covered in the contract will be ready and installed in December, 1923.

Clark-Williams Engineering Company, Bridgeport, Conn., has recently been incorporated to manufacture and deal in poles, railway, structures and other equipment for the support of wires, rails and overhead structures. The capital stock of the concern is $10,000, and the officers are: Roland G. Williams, president; Arthur L. Clark, Bridgeport, treasurer.

C. F. Bulotti Machinery Company, San Francisco, Calif., has moved into its new storeroom at 67-71 Main Street. The new location is in the heart of the machine tool district and gives ample room for display as well as office facilities and immediate shop repair work. This firm has made rapid progress within the last year and is now recognized as one of the leading machine tool houses in central California.

The Norwalk Iron Works Company, South Norwalk, Conn., pioneer builders of compressors, manufacturing air and gas compressors for all purposes and also refrigerating machinery, has just opened a Chicago office. It is located at 627 West Washington Boulevard and is in charge of L. R. Bremser, who for thirteen years was associated with the Gardner Governor Company. He is thoroughly familiar with all angles of the compressor business.

New Advertising Literature

Roller-Smith Company, New York, N. Y., has issued Bulletin No. B-20, describing in detail its phone and loud speakers.

The Sterling Varnish Company, Pittsburgh, Pa., has published a forty-eight-page booklet with accounts of its insulating varnishes, impregnating compounds and baking enamels. Diagrams and descriptive matter tell about vacuum pressure impregnation in general.

Columbia Machine Works, Brooklyn, N. Y., has issued a beautiful thirty-one-page illustrated booklet. This is the first catalog of the kind this company has published. The first page gives a little history of the company referring to the Columbia Service to railways.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has reprinted an article on the "Advantages of Railroad Electrification" by R. J. O'Brien of its heavy traction department that appeared recently in the technical press. The publication is known as reprint No. 128. In answer to the question, "Why electrify?" and "What are the advantages of electrification?" statistics and data acquired from actual operating records on both steam and electric roads serve as a means of comparing the two methods of operation. These statistics touch on fuel consumption, maintenance costs, schedules possible under existing modes of transportation, and other subjects of importance. The feasibility of electric operation in tunnels, on heavy mountain grades, in congested freight yards, or in heavy interurban traffic is also clearly set forth.

Some Real Progress Is Being Made in Standardization

PRESIDENT L. C. DATZ of the Engineering Association has placed standardization at the head of the list of important activities of that organization for the coming year. This is a wise thing to do, particularly in view of the fact that during 1923 those standards which are put up to the American Engineering Standard Committee for ratification can be approved by a much simpler procedure than will be possible later.

But the situation regarding A. E. S. C. procedure is of minor importance compared with that of standardization itself. There must be a consistent and persistent effort to standardize everything inherently standardizable, in the interest of ultimate economy. This is especially necessary now, because there is an increasing "urge to invention" strongly manifest all along the line. This urge is a natural accompaniment of the revival of electric railway activity and should in no way be discouraged. At the same time it needs to be directed along a safe and sane course, otherwise it will result in dissipation of effort and increased costs.

Every time a new device or design comes out, it looks as if the present standards were getting a setback. This is not necessarily so, because in competition each new idea must show its superiority to the cumulative wisdom of the past in its particular field. Hence the present condition of flux in details and even principles of car design, track structure, etc., need not blind any one to the substantial progress that has been made in standardization from year to year. It will be necessary, however, patiently to examine the merits of each proposed advance, and carefully to modify present codes to conform them to modern thought and practice. President Datz and his constituency will have earned the plaudits of the industry if next fall, at the convention, they can show that they have accomplished this.

Bus Men Have Organized a National Association

IT IS but a year ago that the American Electric Railway Association debated and decided against taking bus companies into membership. Prior to that action this paper had urged the wisdom of admitting well-established bus companies to the sobering counsels of the association and commented that if bus men were barred from membership they would sooner or later form an organization of their own, which, having none of the benefits of the experience of the electric railway men, and because of the cold-shoulder attitude of the railway men, would probably tend toward the competitive and belligerent line of endeavor. The association reorganization committee and many individual members also urged that bus companies be admitted.

Week before last the National Motor Transport Association was formed. What the future strength and attitude of this association will be is yet a matter of conjecture, but it wouldn't be hard to guess the kind of thinking a majority of the bus members will get behind. Of course there is some real reason for a separate association of the kind of transportation companies that employ buses, but this could have been very largely satisfied by a friendly and progressive offering on the part of the railway association, such as the formation of an active bus section or even an affiliated association. The bus people would then have been "in the family," where they could have been more quickly taught the true economies of transportation and also the advantages to all concerned of co-ordinated rather than competitive systems. As things are, the same end must ultimately obtain, because it is the only economically sound basis, and because the commissions are going to direct co-ordination. But the process will be slower and the damage to the railways greater. Perhaps much good could be done even yet if the railway association were to take the initiative in establishing friendly relations with the new bus association and in endeavoring to work with the latter to reconcile interests.

Sound Commission Thinking Improves Railway Outlook

THAT the obvious injustice of permitting bus operation to come into destructive and uncontrolled competition with the closely regulated electric railway is not going to prevail becomes daily more certain as commission decisions on the subject accumulate. Within the last two weeks two utilities commissions have spoken very clearly on this important matter. The Illinois Commerce Commission, in granting a certificate for a large bus undertaking in Chicago, was careful that the operation of buses should be confined to routes that would provide a needed service and not jeopardize the earnings of the street railway, on which the transportation of the city must primarily depend. During the present week the commission of the District of Columbia declined to grant even a small extension to the routes served by the Washington Rapid Transit Company, on the ground that the bus operation already permitted had so eaten into the revenues of the Washington Railway & Electric Company as to take the cream of the business, whereas bus operation should be authorized only where it will create a new traffic of its own without materially affecting that of existing rail routes. The commission explains the granting of the certificate for the initial bus operation in the capital city by saying that, at the time, the traction company was unable to handle the business in the rush hours and that the service was really inadequate. But this condition has changed and the commission seems fully aware that the service is at present of a competitive nature and for that reason does not improve the local transportation situation.

At the recent convention of the national association of utilities commissioners there was a remarkable unanimity of opinion as to the place of the bus in the scheme of transportation. There was general agreement that taxes must be more equitably distributed as between railway and bus and that certificates should be granted to bus companies only where the operation would be permanent and not in competition with a rail line that was already giving adequate transportation service.

So the competitive situation is steadily improving and there would seem to be little to fear where the utilities commission has jurisdiction over the buses. Unfortunately there are only twenty-one states where the commission does have jurisdiction now, but the bus line is a utility and the tendency is distinctly to put it under the commission. Where railway men can do their most effective work is to push the revision of the state utilities act so that the commission's authority will comprise regulation of all common carriers to the same extent that it does the railway.

But legislative processes are a little slow sometimes. Meanwhile, bus competition unregulated and destructively competitive is going on and something ought to be done right now. The answer is for the railway to get into the bus business itself in self-defense, if for no better reason. Is it anything but just plain common sense to invest a few thousand dollars in buses to protect an investment of several millions in the railway? Or is it better just to sit by, lamenting the great unfairness of it all and damning the bus fellow who is pirating the business, while waiting for the traction funeral?

There Must Be Some Way to Control the Vehicle-Collision Situation

THE alarming increase in annual numbers of collisions between cars and vehicles on many properties necessitates prompt and vigorous action by municipalities and electric railways, as well as vehicle owners and drivers. At the recent meeting of the T. & T. Association committee on accident prevention this topic was considered as the most pressing one now before the railway operator.

It appears that as soon as one source of danger in car operation is eliminated another takes its place. Years ago street vehicle and pedestrian traffic presented operating difficulties which were largely overcome through the use of the air brake, through improvement in traffic rules and through skill in car manipulation. Then came boarding and alighting accidents, now under control due to the widespread use of folding steps and inclosed platforms. Next comes the phenomenal spread in the use of the automobile, frequently operated by drivers with indifferent training, and the furious driving of the taxicabs, to the chauffeurs of which applies the statement of the watchman, recorded in Kings II, chap. IX.: "The driving is like the driving of Jehu the son of Nimshi; for he driveth furiously." No wonder the transportation superintendent and the claims attorney spend much energy in racking their brains for ways to get cars through the traffic with less loss of life, limb and property.

There is not going to be found any royal road to accident mitigation. It is coming by way of attention to detail and by arousing some kind of a spirit of co-operation The responsibility of the management of electric railways is to see that neither motorman nor vehicle driver has any excuse for a smash between a car and an automobile.

Washington a Good Place for a Midyear Meeting

EVERY one able to have gone to San Francisco for a midyear meeting next spring will regret that that city was not selected at the meeting of the executive committee last week. Nevertheless the choice of Washington was a wise one. Only thirty-one railway delegates living east of the Mississippi River had agreed to go to San Francisco, and this with the smaller number who could have attended from west of the Mississippi was admittedly insufficient for a representative meeting. The fact is that the spring is a very busy time on most railway properties, and while the thought of a trip to California is alluring, not many can arrange to take the two or three weeks necessary, or at least to decide definitely three months in advance that they can get away by a certain date.

Washington not only has the advantage of being near at hand for the great majority of the membership but will make a good convention city for many reasons. A trip to Washington can often be combined with other business, and the growing interest of electric railways in national government affairs makes the selection of Washington particularly appropriate.

The last convention which the association held in Washington was on Jan. 29, 1915, and was one of the most largely attended in the history of the association. One of the speakers was President Wilson, who, in an address of more than 4,000 words, impressed upon the delegates his interest in the success of the electric railway as an important social and economic force in every community. The sympathy expressed in this speech was later shown in more tangible form by the appointment of the Federal Electric Railways Commission, which was instructed to investigate the condition of the electric railways, at that time admittedly serious, and recommend a remedy.

Since the 1915 meeting the relations of the electric railways with the federal government have become even closer than they were at that time—nearly eight years ago. This is particularly true in connection with such branches of the government as the Interstate Commerce Commission on the question of rates, the Department of the Treasury on the matter of federal income taxes, the Department of Commerce, particularly as the latter is represented in its statistical department and the Bureau of Standards, and the Department of Labor as regards its studies on the cost of living and labor statistics in general. In addition, of course, the electric railway industry is often very closely affected by Congressional action. In fact, so much is this the case that during the past few years the committee on national relations of the association has kept a representative in Washington through whom testimony on bills in Congress affecting electric railway operation may be presented to the appropriate Congressional committee.

This means that a meeting at Washington will accomplish two results, outside of those which would be obtained if the meeting were held elsewhere. One of these is that it will draw the attention of the delegates to affairs at Washington to a greater extent and awaken their interest in the very important work of the committee on national relations. The second is the converse of that just mentioned and is that the attendance of a large body of important railway men in Washington will help to establish the importance of the industry in the minds of many members in Congress and other representatives of the national government.

Keep Ahead of the Procession

Anticipate the Desires of the Public—Speed, Comfort, Cleanliness and Courtesy Necessary—A High Class of Platform Men Needed—Lighter Equipment a Certainty—The Bus a Transportation Tool

An Interview with

C. D. Emmons

President American Electric Railway Association
President United Railways & Electric Company, Baltimore, Md.

By Harold V. Bozell
Consulting Editor *Electric Railway Journal*

"KEEP ahead of the procession—lead not only by your own ideas, but see what the other fellow is doing that is good and fit the good things together. But most important, find out what the right thing to do is and do it just a little before it may be expected of you." The foregoing quotation might well epitomize the leading idea which Mr. Emmons, the new president of the American Electric Railway Association and president of one of the most progressive electric railway properties in the United States, expressed recently in a most interesting visit I had with him to discuss the outstanding electric railway problems of today and to get his ideas, as a leader of the industry, as to what the railways could most advantageously do. We have all of us been saying for some time that the industry is coming back—the saying is getting trite, truthful though it may be. But Mr. Emmons points out that the industry must know how to take advantage of this returning prosperity and that the degree with which the "come-back" is accomplished depends upon those who are operating the railways today.

"We have to tackle the problem of keeping public good will with this coming back," said Mr. Emmons. "We must put ourselves out a little to keep ahead of the procession, so that the public may know we are progressive and ever on the alert to provide the very best transportation to suit the community's needs.

"There are lots of fine ideas floating around—each one of us is thinking out new things and we are exchanging information at conventions and through the technical press. Managers must see that their companies get the benefit from ideas which have already been given to them and to their men on the properties. No man can do his duty by his company if he does not apply practices which he has learned are to the advantage of both the public and the company."

Those who know Mr. Emmons know that he is what he is because he has lived and acted according to the precepts which he outlined as above. Every step up that he has taken has been because some one has recognized that he was doing the job he had so well that there must be greater possibilities in him; every step he has taken has been without any pull or due to influential acquaintanceship.

There is another point which ought to be mentioned in connection with Mr. Emmons' becoming president of the association, and that is that this practically marks the coming of the third generation in the electric railway industry. Previous presidents in the association will not misunderstand this statement, which originated, I believe, with the veteran reporter T. E. Crossman, whom the association presented with a monogrammed fob at Chicago in commemoration of the fact that that convention was the fortieth consecutive railway convention that Mr. Crossman had reported. Two twenty-year periods had passed, Mr. Crossman pointed out, and this is the first year of the third twenty-year period. The first generation consisted of the men who were leaders of the industry at the start—men who are executives of the early street railways when the association began its life. The second generation consisted of executives who had started as younger men during the administration of the first generation. Now, the third generation takes hold—men who entered an industry which was already in full swing and who have risen to executive positions on account of their progressive ability. Mr. Emmons marks the first of these men to become the head of the industry for an administrative year.

But to return for a little more analysis of what Mr. Emmons means by keeping ahead of the procession. "Take transportation service furnished, for example. The man behind the procession will wait for traffic to increase 5 per cent before he increases his mileage even 2 per cent. There is a lag in furnishing service, which is noticeable to the community. When one is ahead of the procession he knows it is coming, or at least he can keep his car mileage abreast of the traffic and maintain a satisfied public. Furthermore, keep on good terms with the public through real service, through courtesy, and almost above all through the handling of complaints."

I found out that Mr. Emmons lives up to what he preaches on the question of complaints. Records of the company show that it was not so long ago that complaints averaged eighteen to twenty per day in the offices of the United Railways in Baltimore, whereas the records for October, 1922, showed eighty-three complaints for the whole month, and at the same time there were more than eighty-three commendatory letters of the service and courtesy on the Baltimore lines.

"Courteous employees and clean cars—I wish we could keep our own cleaner than we actually do—go a long way in keeping public good will. *Dirt grates on the public.*

"And we must study intensively this question of greater speed. Not only is greater speed a question of more car-miles per car-hour, but it is a very important question in the selling of transportation for people to want to get where they are going as quickly as possible. The question today of speeding up cars is of course very difficult on account of automobile occupancy of the streets, and yet I hate to object to the automobile because it is popular. We must find our solution in spite of the automobile or, more properly put, in co-operation with the automobile and with the traffic authorities of the city.

"Then, too, there is quite a revolution in reducing the weight of cars. We all overdid the question of heavy cars in the earlier days. Our equipment was too heavy, and as a consequence at times our speed was too low or we had to carry excessive motor equipment. Today the industry is showing progress in reducing the weight of cars, and the manufacturers have assisted materially in producing light-weight cars and also light-weight equipment to replace the heavier equipment. All this results in lower operating costs and faster, more comfortable service.

"All these things are a part of keeping just a little ahead of what the public may demand—it is first-class operation and first-class public relations which win out and make a property not only a financial success but a success in its service to the community and therefore recognized as an asset to the community.

"Of course there are problems—it is not all easy sailing. And one of the elements which is militating against the most economical street car ride for the car rider is still the burden of paving and its maintenance which is imposed on so many railways. I notice that this question is a very live one in England today as well as in this country. In certain places the community has recognized the situation and has given some relief. It is also interesting to note that as soon as municipalities take over electric railways, in those cases where municipal ownership now exists, the municipal authorities quickly recognize the injustice or the absurdity of loading paving maintenance charges upon car riders. Witness the recent attempt of Mayor Couzens of Detroit to have the Department of Street Railways relieved of the paving charge."

I found Mr. Emmons naturally hesitant to discuss the question of wages of electric railway employees, because this is a subject which it is so easy to misunderstand. His expression on the subject, however, showed the same keen sense of proportion that one has come to expect always from Mr. Emmons. His analysis of the situation is that for a good many years previous to the disturbed economic situation of the past five or six years the wage level of car men was too low as a consequence of the level of the car fare, which was itself too low. The public has come to recognize, in large part, both situations, and so long as car men's wages are at the level, relatively, of wages in other comparable lines, the railways should maintain the wage and also the fare. "I doubt," said Mr. Emmons, "if wages in general industries will go much lower very soon, if ever. Managements of railway properties owe it to their men to maintain wage levels commensurate with character of employment. It is so easy to be misunderstood on this that I would not wish my remarks to be interpreted as meaning that there are no places in which wages of car men should be reduced. I am discussing merely the general philosophy of wage levels and street car fare as compared with general wage levels and economic conditions."

I asked Mr. Emmons what effect he thought there would be on both traffic and necessity for higher fares if there were no further liquidation in general labor. He said he thought that the effect of high wage levels on traffic would not be much, because on the whole there was a higher living level and the cost of other commodities would retain the same relative level. There is this effect, however, and that is that the numerous very cheap automobiles are having an effect on street car traffic—not only as to the actual riding but also upon the problem of getting cars through congested districts. Mr. Emmons sees some very difficult problems to work out with reference to the large numbers of automobiles in downtown districts, in connection with street car traffic. As to the need of higher fares, with the exception of certain places where the political situation has clouded all fare adjustments during the past period, his attitude is that the railways are in duty bound to work the problem out on present increased fares, in those places where fare increases were granted during the adjustment period.

"How about municipal ownership? Will other cities follow Detroit, Seattle and San Francisco, or will they attempt to follow Mayor Hylan's lead and encourage bus competition?"

"I don't think there is much of a tendency toward municipal ownership. There are too many cases both abroad and at home of municipally or government-owned public utilities being made into political footballs, with slow or inefficient operation, and these examples tend on the whole to keep people away from the idea unless it is forced upon them. As to bus competition by municipalities to weaken the railway transportation systems, in the end the people must and will see that the transportation system of a community must be protected for public service. Investors will not put their money into transportation systems unless they see that they are sound and have the community behind them. There is a double responsibility here, of course, on the management and the public, but the public must and will realize also that persons with money to invest will not invest in any enterprise in a community unless there is a dependable transportation system and unless money invested in utilities is recognized and protected. The people can be made to see that those communities which are successful have successful utilities, and all that statement signifies.

"I think neutral agencies, such as the *Electric Railway Journal*, can do much to assist the industry as a whole, whether under private ownership or municipal ownership, to make impartial analyses of the operation of municipally owned systems, because facts, of course, are what we want."

I asked Mr. Emmons if he thought the railway association should continue to exclude municipal railways from membership, and he answered that he was on record as being in favor of having them in the association. He thought that was the best way to work out the answer to the question of municipal ownership. He also thought that bus companies should be admitted. Otherwise they would form an association of their own. This would mean that the bus question would have to be worked out through associations which would tend to be competitive and antagonistic rather than through one transportation association where the problems could be worked out on a co-operative basis. (Since this interview with Mr. Emmons a national bus association has actually been formed, as already noted in these columns, with E. B. Burritt, former secretary of the American Electric Railway Association, as its executive manager.)

Keeping Ahead of the Procession

THERE are lots of fine ideas floating around — managers must see that their properties get the benefit from ideas which have been given to them and to their men.

There is quite a revolution in reducing the weight of cars. . . . This results in lower operating costs and faster, more comfortable service.

We must and can speed up our service.

We must let the employee know that we think something of him as a man. We should do all we can to get high class employees.

Courteous employees and clean cars go a long way in keeping public good will. *Dirt grates on the public.*

Continuing, Mr. Emmons said: "What we do need is the education of communities and public service commissions that there is only room for one transportation facility for one community, and that this transportation facility must be protected against wastage. The railways—and we have tried to do this in Baltimore—can educate the communities in this way by showing the communities that they are ready to supply any necessary bus service in a community. The National Association of Railway & Public Utilities Commissioners can do, and as a matter of fact is doing, a great deal in this direction and the individual state commissions can do much more. In fact it is difficult without the co-operation of the public service commissions to do very much in this line. A railway company which sees the necessity of auxiliary bus lines should be protected, when it installs them, against jitney competition there as well as against rail lines. There are certain places where auxiliary bus lines are warranted, and I think it is unfortunate for the railway in any such locality, as well as for the industry as a whole, if the railway does not recognize this and get there first.

"I think the same philosophy applies to the trackless trolley, which has its place in certain kinds of traffic and under certain situations and, when carried to an electric railway property, will prove, I believe, less expensive to operate than buses, vehicle for vehicle. I don't mean to get into any debate with reference to the place of the trackless trolley and the place of the gasoline bus, realizing that the fixed investment of the trackless trolley is a factor dependent upon the amount of traffic to be handled. But the trackless trolley does have a definite place—or I believe it will be found to have a definite place in local transportation activities."

I ventured to ask Mr. Emmons if he would express an opinion as to the usefulness of or the service rendered by *Bus Transportation*, the co-worker of *Electric Railway Journal*, in trying to solve the problem of the place of the bus.

"I think the effect of *Bus Transportation* has been good—it has been very helpful to all of us, and street railway men, no matter what they think with reference to the bus, get good from it. I think it will materially assist in developing bus transportation in non-railway territory, as well as in working out the problem of the proper relation between bus and railway in territories where the electric railway is already located and is a necessary part of the transportation system."

"What do you see in the way of economies and improvements of service available for use by electric railways now or in the near future," I asked.

"We must and can speed up our service. We must eliminate downtown congestion, possibly by spreading the distance between stops, although of course, this cannot be carried too far. Many stops slow a car down, but at present in many cities the number of stops per mile or the location of stops close together is a matter of legislative requirement by the city. We are beginning to realize that the street car must be made to approximate as nearly as possible to the individual automobile as to speed, convenience and time of travel from one point to another. Don't misunderstand me here—I do not mean the bus. But every individual has in the back of his brain the idea of liking to ride home in a private automobile with all the comforts that that means. Naturally we cannot do this—there isn't room on the streets for automobile transportation, either in individual cars or in buses in most of our cities. But we can speed up our service and I have already touched upon the place of the light car in this.

"I see no immediate wonderful change. It is a constant plugging away and using the best thing here and the best thing there. Every one is watching the weekly pass as to its effect on stimulating riding. In its application, we must be careful about increasing the number of rides and lowering the gross income. The application of the pass is a proposition which must not be bungled. Fares and passes must be applied correctly.

"The problem of the electric railway is to give service as good as possible and as cheap as possible.

"Safety movements can do a great deal of good toward reducing gross expenditures for accidents both to the public and to employees. In Baltimore, for example, we set aside 4 per cent of our earnings for the claims department and damages, and I think safety movements can materially reduce similar sums on our own property and elsewhere.

"Then there is the one-man car, for which I see a very much greater use than it now has. There are many excellent types of one-man cars to fit various conditions and they are surely economical. There is no doubt but that they have saved some properties from financial ruin, as well as saving them in the public grace of their community. I see no reason why every small city should not be a one-man car proposition. And there are of course a good many places in larger cities where one-man car operation is logical. Who knows? What with the advent of turnstile and other devices, we may ultimately reach all one-man operation with even greater transportation speed than we have now."

"What actual gain is going to come from having platform men of larger experience now being employed because of smaller turnover or of higher grade because of more careful means of selection?"

"There is a gain in many ways. There is a gain in having people properly handled by some one who knows his job; there is a real gain in the care of equipment which shows up in reduced maintenance cost per car-mile; there is a real gain in good will to have people who know how to handle the public and there is also a gain in return due to a greater degree of honesty in the handling of fare collected by old and tried employees. There is a gain in the reduced number of accidents, and this is one reason for paying older men more than men new on the property. I think we should do all we can to get high-class employees and to reduce the labor turnover. We must let the employee know that we think something of him as a man. We must realize and let him know that we realize that he has a wife and family who are as dear to him as the manager's family is to him. It is all good common sense—good business, and what ought to be expected in rational human dealing."

"Would you express an opinion on the interurban situation?"

"I have been away from the interurban problems for three years, and of course cannot talk very intimately about them. But I do believe that the interurbans exceeded the city systems in going crazy on car weight. There has been a considerable backing up on this position within the past year or two, and it is going to be a great help to the interurbans to take the position tending toward lighter equipment. There is no doubt a saving in track wear due to the lighter equipment; there is a saving in kilowatt-hour consumption per car-mile, which is not merely theoretical, but which is real and which is more of an item today than it was at former fuel and labor costs; there is a saving on depreciation on the investment (and this is not only per car, but actually per passenger-mile) and then there is a further saving in the one-man interurban car, which I see being used now on some systems."

"How about the zone fare—is it dead as a possibility in this country?"

"You know the English say that the penny is too popular a coin for the railways not to give some sort of a ride for it. But we recognize that the Englishman is a patient person whereas the American public is impatient. The collection of zone fare, according to any scheme so far devised, seems to test the patience of the American public. The zone fare has many advantages in theory but, so far as it has been worked out in this country, it is impractical. It was unfortunate that the Connecticut Company's experiment could not have continued longer, but under the circumstances this apparently was not feasible.* I don't know, maybe some day some one will try it again."

There is one question about which a good deal of discussion has centered in the industry in the past few years and that is the question of valuation and capitalization and rate of return and the relation of these to each other. On this Mr. Emmons pointed out that a good deal of capital was put out a good many years ago at a low rate of interest. In refinancing to make capitalization equal valuation in some cases, a lower capitalization at a higher rate of return could be adjusted to mean the same thing to the investor and perhaps would leave a better taste in the mouth of the public which recognized a fair rate of return for the property as a whole on the valuation allowed. Mr. Emmons said he strongly supported "businesslike valuations, made on the yardstick basis, toward which the valuation committee of the American Electric Railway Association is now working."

"In this subject, as in all other subjects, the railways can impress themselves upon their public by taking the lead in a progressive, substantial and convincing way. There is nothing to be pessimistic about in the railway situation. The transportation requirements of our communities will increase rather than decrease. There are plenty of problems for every electric railway, plenty of opportunities for every electric railway man. My advice in realizing or capitalizing upon these problems is to keep ahead of the procession."

Training School for Trainmen in St. Louis

THE training school for motormen and conductors on the United Railways of St. Louis embodies a number of novel features. Besides the usual instruction for motormen on the operation of the car control and brake system, which is given on a four-motor passenger car and trailer similar to those used in service, the men receive instruction on the need for avoiding accidents, method of making out accident reports, the importance of courtesy and efficiency and similar public policy matters.

After a period of instruction on the road, they return to the instruction room for a review of the most important features of the first instruction and are examined as to their knowledge of the operation of the various parts of the brake and control equipment, method of making emergency stops, with reverse power, etc. They are also asked to estimate the distance required to stop a car with air brake on level drive rail going at a rate of 10 m.p.h. The purpose of this is to assist them in answering questions in accident blanks and in court that relate to speed and distance.

Applicants for the position of conductor, as part of their school work, are encouraged to take some of their practice trip sheets home for study as well as trip sheets properly made out with the exception of being balanced, so that they may balance them and return them when they report in the morning. Another part of their homework consists of 100 subtractions of register readings, in which the most difficult numbers possible are used.

In their schoolroom practice the applicants are required first to pool their money except bills of large denominations, then take turns acting as conductors and as passengers, the passengers all paying their fares with quarters or halves and requiring the acting conductor to issue a transfer with the payment of each fare. Crews are changed every twenty minutes until each conductor has demonstrated his ability to act efficiently in that capacity. At the conclusion of the trial, the money pooled by each applicant is returned to him by the company.

---

*For a discussion of the reasons leading up to the abandonment of the zone-fare experiment by the Connecticut Company, see *Electric Railway Journal*, Aug. 7, 1920, page 253.

Review of Transit Commission Valuation

Consulting Engineer Finds Many Errors of Omission and Commission in State Commission's Tentative Valuation of Brooklyn Surface Roads and Questions the Methods Followed

THE results of a valuation of the surface railroads of Brooklyn, conducted under his direction, have just been made public by Francis Blossom, member of the firm of Sanderson & Porter, consulting engineers, New York. The valuation was made, so far as practicable, in conformity with the methods and procedure followed by the valuation bureau of the New York Transit Commission, as reported in the *Electric Railway Journal* for Feb. 25, 1922. Mr. Blossom was assisted in the work by a large staff, among whom he mentions particularly R. S. Buck, Thomas F. Mullaney, J. R. C. Armstrong, Charles A. Remelius and Julius A. Hanna, all long engaged in railway work or the manufacture of railway equipment. The valuation covered the properties of the Nassau Electric Railroad, Coney Island & Brooklyn Railroad, Brooklyn, Queens County & Suburban Railroad, South Brooklyn Railway and lessor companies, Brooklyn Heights Railroad, Coney Island & Gravesend Railway, and Brooklyn City Railroad.

CRITICISMS OF PRINCIPLES

The report first criticises various general principles or methods of the commission's tentative valuation, as contained in its introductory statement. These criticisms in part follow:

The "original cost" valuation described in the report appears to be a mixture of estimated and of actual costs and of many assumptions, indicating that the valuing engineer has presented figures which show what he thought the properties probably cost or should have cost—under conditions he assumes to have existed when he assumes they were created—rather than what they actually did cost, on a recognized accounting basis. The costs and prices prevailing one or two generations ago are not either normal or applicable to present purchase and sale appraisals, and can have no value therein. They might warrant consideration in a rate case to arrive at an "investor's sacrifice" figure of cost. This would necessarily include accrued deficits in fair return, or going value under the New York law, and other direct and indirect costs.

The 1910-1914 reconstruction cost described in the valuation report uses prices which it designates "pre-war prices." These are supposed to be the prices prevailing during such years, but appear to be the extremely low prices of 1914. These also have passed away. While nearer the prices of today than are the original costs of prior years, there is no justification for calling 1910-1914 prices normal except for their own period. They are super-normal judged by many earlier or lower prices, and sub-normal judged by the higher prices which have since prevailed. Neither does a normal exchange value of commodities exist, although the ratio of the average price of rails and mechanical and electrical equipment, etc., to the average of living costs is much less variable than the ratios of prices of single commodities. The gold dollar shows the most extreme variation in value as measured by everything else.

The 1921 reconstruction cost valuation described in the report is based on an inventory stated therein to have been made as of June 30, 1921, and on prices stated in report to be taken in the "period of the first six months of 1921, which was immediately preceding the completion of the inventory, and intended to reflect the then 'present-day prices and conditions.'"

In each of the three above-described bases of negotiation the report states that deduction should be made either for depreciation or for the cost of putting the properties into first-class operating condition. In this connection, the report states under the caption "depreciation," that "in considering the investor it would become necessary to trace the actual investment of the present holders of the securities, and to ascertain whether such investment when made reflected the depreciated condition of the property before any injustice in deducting depreciation from the full valuation of the property could be seriously maintained. Investors in transit properties have changed many times since operation was first commenced, and the price paid in the transfer undoubtedly considered the condition of the property." This is incorrect, for a stockholder succeeds to all rights of a previous stockholder, and the justice or injustice of any method of treating depreciation cannot be affected by a change in the ownership of securities—whether such change is effected by purchase, gift, bequest, exchange or otherwise. Moreover, prices paid for stock are usually dependent on present or prospective earnings.

The report further states that "the straight line basis has been quite uniformly accepted as the most practical means of determining the amount which should be deducted from the value of the property to which depreciation applies." This statement also is incorrect. Such basis has been quite uniformly rejected. This is admitted in testimony given at the hearings held since the report was presented. The reason it is rejected is that the straight line method is illogical. It takes no cognizance of the wear, tear, use, exposure or condition of the property, nor of the amount of the expenditures made thereon for maintenance, repairs, renewals and replacements. On the straight line depreciation theory of the valuation report two pieces of equipment of the same age are given the same depreciation, and the facts as to their real condition are ignored.

Two methods of computing depreciation are used in the report, viz.: (a) Straight line depreciation, based on the proportion that the estimated expired portion of the estimated life (with allowance for estimated salvage or scrap value) bears to the total estimated life (such life being speculative or unknown in many cases) and (b) depreciation determined by the estimated cost in 1921 of placing the properties in first-class operating condition.

The report advocates taking the so-called "original costs," and subtracting therefrom the cost of placing the properties in first-class operating condition at the higher prices of 1921. It includes in the amounts so deducted both its estimated "deferred maintenance" and its estimated "deferred replacements," i.e., in addition to deferred maintenance the report deducts much accrued straight line depreciation. The report then recommends that the amount of residue, ignoring estimated value of the non-operating property, be offered to the owners, in bonds.

The method used in this connection is stated in the valuation report under the caption "conclusions and recommendations," and reads: "It is our conclusion that a fair valuation for the existing property of companies other than that included under Contracts Nos. 1, 2, 3 and 4 and their related certificates would consist in allowing the original cost less the expenditures necessary to put the property in first-class condition." I do not agree with this conclusion. It is difficult to see how it could be reached by business men. Certainly none of those who wrote the report would consider such a method of valuation fair if applied to their own home or property. If the conclusion or rule expressed in the report were generally applied owners might have to part with property for nothing, or pay a buyer for taking it. It penalizes investors who, instead of waiting until 1921, spent their money twenty, thirty or more years ago to serve the public. A cubic yard of excavation or fill work done in 1890 is now as valuable to the public as if done in 1920. Had the conclusion or rule been originally announced that investors in other kinds of property than railroads would get appreciation in value but that owners of public service property would be denied any appreciation of value if and when they sold their property, Brooklynites would probably now be walking or riding in horse cars or buses. This valuation is for the purpose of purchase. For all work, whenever built, it would seem that the owners are entitled to receive its present value.

Herein I deal with basis number three, mentioned above and given in the report, namely, reconstruction cost at 1921 prices, because I do not consider that a valuation arrived at by any other method will meet the tests of current business practice for the purposes of proposed negotiations.

The report states under caption "expenditures necessary to place property in first-class operating condition" that the present-day condition is not necessarily that of June 30, 1921. This statement is particularly true now, as very liberal expenditures on maintenance have been made since the enaction of the transit act, and the values of the properties are now correspondingly increased. The lesser prices of the present day would, by reducing the costs of the work which the report deducts as necessary to put the properties in good condition—show larger values for each of the properties. The report includes in the amount which it so deducts at 1921 prices: (a) An estimated amount to cover the estimated requirements for overcoming deferred maintenance, and (b) a large additional estimated amount to cover its estimates for "deferred replacements" of equipment, i.e., equipment which it assumes should be retired from service.

Moreover, such deferred replacements have been determined by an erroneous method, i.e., by assuming the expenditure of money to place property in first-class condition and then retiring such property. An indication of the magnitude of the amount that the report claims should be allowed for deferred replacements is given by the statement appearing in report for Public Service Commission, First District, New York, for year ending Dec. 31, 1920, on page 88, which gives the then deferred maintenance of the surface lines as follows: Cars—all companies (based on 3,100 cars) $231,159; track and paving, for the six companies considered, $4,295,159.

The deferred maintenance plus deferred replacements for these same companies is estimated for 1921 in valuation report at $11,368,645.

In this connection the valuation report states "it is believed that due consideration should be given to an estimate of the necessary expenditures of this character as a practical means of determining the actual rather than the theoretical depreciation. Life is necessarily affected by the standard of the repairs. Renovation and rehabilitation from time to time will operate to make over and renew and if successively continued may prolong the line in service to an extent difficult to estimate." This statement cancels the preceding statement in the report which says in effect that it is proper to deduct theoretical depreciation based on age. It substantiates the contention made by the companies that, for proper determination of depreciation, findings must not be theoretical but must be based on inspection and on facts.

The Brooklyn surface road properties are now in seasoned condition and require only that enough money be spent on them to enable them to give a quality of service equal to that which the same properties could give if new. To spend more than this amount would be wasteful and extravagant. In arriving at a purchase and sale figure it may be proper to allow a credit, from the value of the property if new, in amount sufficient to put these properties into condition to give first-class service, but it is not proper to deduct the capital cost of new equipment expected to be purchased with the object of increasing the net earnings receivable by the new owners.

Certain general costs, some of which are mentioned in the report, apply to all the Brooklyn surface roads. Such costs include the construction overhead costs and the company overhead costs, whereas, the direct individual property costs for materials and labor are a function of quantities in each case and of their corresponding unit costs. All such general costs are as inevitable and unavoidable as the costs of steel rails or cars. They may be computed either on the basis of material and labor costs or they may be based on reasonable estimates fixed by experience had in the building of similar properties.

The report underestimates the allowances that must be made for costs of land and right of way. Such costs must, as estimated by Mr. Bennington, be taken on the average at not less than 1.60 times the assessed valuation. In the case of the land owned by the Coney Island & Brooklyn Terminal Company, which is a business corporation and not a railroad company, the land is believed by the company to be salable at more than double the assessed valuation. The report does not even include the necessarily incurred costs incidental to the acquisition of the land and right-of-way, nor the costs such as interest and taxes, of carrying the investment in land and right-of-way during construction. This land must, in most cases, be acquired well in advance of the starting of construction. Interest must be thereafter paid on its cost, and taxes are thereafter payable on such property and must be paid if the tax department does its duty.

The report states that easements, private right-of-way, consents and damages, should be limited in all valuations to the original cost shown on the books, and that they have not enhanced by land value increases or rental value increases. This statement is incorrect as would be soon discovered by any company now attempting to obtain such property and rights or to meet the damage claims that would develop. Even after making this reference to and statement regarding such items the report omits to value any of them except private right-of-way.

As to the methods used in making its valuations, the report has assumed that only a portion of the work would be reconstructed by the contract method. This assumption is contrary to customary practice. If the work were so rebuilt, as contemplated in the report, the company costs, including its administrative and engineering costs, would be greater by enough to offset the saving in job overheads and contractor's services which the report erroneously assumes could so be effected.

OMISSIONS

The commission valuation report, Mr. Blossom says, also omits many items of value, such as extra cost of piecemeal construction, many miles of irrevocable and perpetual easements, development costs of physical property and business, advantageous advertising and power contracts and franchises, and much property which is useful in the operation of the lines but not now actually in use, such as that purchased to provide reserve capacity.

OVERHEAD AS DETERMINED IN THE REPORT

Mr. Blossom also criticises the method of determining "overhead" as well as some of the nomenclature used in the commission valuation report. He explains that in the statistical section, which gives unit cost data, the report adds, but only in the case of some items, the amount of 6 per cent for "job overhead," making what is therein called "construction costs." To this it adds, but only in the case of some items, the amount of 10 per cent for "contractor's services," making what is therein called "contract costs." However, in making up the estimates of "contract costs" for electrical and mechanical equipment and rolling stock, the report adds no overhead but uses the manufacturer's bare selling price to the company, stating that this price corresponds to the above-mentioned "contract costs," which, in the case of track and structures, is the amount paid to the contractor for the finished work, ready to operate. In other words, this means that in the report no allowances for job overhead or contractor's services are included in the electrical and mechanical equipment and rolling stock. The report then adds to "contract costs," as made up from the sum of the foregoing items, certain estimated overhead and other charges to the company. It terms these "company overhead charges" and divides them into "expenses during development" and "expenses during construction."

"Cost to reproduce," according to Mr. Blossom, is made up in the commission report from the total of the estimated costs mentioned above, plus the value placed on land, right-of-way and materials and supplies, though in the last three items, the report includes no overhead or carrying costs. On this method of valuation Mr. Blossom says, in part:

> A company or organization reconstructing the Brooklyn surface railroads in 1921 would hove had to pay costs for company overheads in excess of the percentages and amounts allowed in the valuation report of Feb. 15, 1922. A similar statement also applies to the construction overheads. The report depreciates the construction overheads and the company overheads. The company overheads should not be depreciated because the creative engineering, legal and administrative work and the expenses of insurance, taxes, interest and cost of money, once made are permanent and will never be duplicated. Some of the construction overheads will be duplicated when making renewals and

replacements but this statement does not apply to all of the construction overheads or to all of the physical property.

The report appears to allow construction overheads only on track and structures, made up of 6 per cent for "job overhead" and 10 per cent for "contractor's services" (including therein contractor's home office overhead and profit). These, combined, amount to 16.6 per cent, which seems entirely inadequate. My practice in such work is to allow at least 12 per cent for job overhead and to figure it on all (except rolling stock, to which I add 3 per cent) instead of on only a part of the work. The 12 per cent is made up of 4 per cent for contractor's works office costs and 8 per cent for all other items under (a) and (b) of the next following paragraphs. In my opinion this 12 per cent, so figured, should be used in these valuations instead of the 6 per cent as used and figured. The 12 per cent for "job overhead" and the 10 per cent for "contractor's services," combined, amount to 23.2 per cent.

"Contract cost" as defined in report must include the following construction costs: (a) All items listed in report as having been included in "contract cost," (b) express, freight, demurrage, telephone, telegraph, storeroom, storage, yard, automobile hire, cartage, rental, job liability insurance, incidentals, extras, omissions, mistakes, changes, corrections, breakage and waste, rehandling, temporary construction and duplication of work, removal of poor work, removal of obstructions or interferences, excess cost of doing work while maintaining operation, idle or overtime labor, power, heating, lighting for nightwork, failure of sub-contractors and reletting of work, delays, strikes, accidents, weather damage, disasters, miscarriage of shipments, city inspection and permits, bonds, fees, all other uninsurable costs, injuries and damages to persons and property, operation of job shops, construction plant maintenance, trial operation, contractors' works office costs and remuneration for contractors' services, including therein his home office overhead costs.

"Cost to reproduce" as defined in report must include the following company costs: (a) Company overhead costs during construction, such as interest during construction on all expenditures made, taxes during construction, engineering costs, administrative costs, fire insurance; (b) company's costs prior to construction, such as promoter's remuneration for services and expenses, administrative, legal and engineering costs, interest on expenditures made, and taxes on land and right-of-way and on structures; (c) cost of procuring money; and (d) company's costs subsequent to construction, such as working capital, physical property development costs, costs to create the business, and the value of contracts for power, advertising, etc.

Mr. Blossom gives in his report his comments at some length on the various items listed under "cost to reproduce." Speaking first of interest during construction, he points out that this money must often be raised before the work begins and that any organization constructing or reconstructing the Brooklyn surface routes would have had to pay for construction money an annual interest rate of at least 8 per cent, because a lender advancing money for construction would consider the hazards and risks of a loan on an unbuilt project. In 1921 the annual interest rate would have been more than 8 per cent. The interest period must be computed from the time the money is raised until construction is completed and operation begins. The least average interest period would be 2½ years on land, right-of-way and damages, three months on rolling stock, and one year on other property, and it might often be more. Taxes are payable on land and right-of-way after their acquisition, and they are also payable on building structures.

Engineering design and inspection costs would range between 3 per cent and 4 per cent of the full construction costs, including therein the job overhead and the payment for contractor's services. Administrative, legal and office costs during the construction period would range from 2 per cent to 3 per cent of the fair construction costs, including therein the job overhead and the contractor's services. Fire insurance would be not less than 0.4 per cent per year, payable for at least a year on the insurable portions above the foundation of buildings under construction, power plant and substation equipment, and for at least three months on rolling stock. This item would amount to at least 0.05 per cent of the contract costs, exclusive of land and right-of-way.

Discussing the items included under "Company's Costs Prior to Construction," Mr. Blossom declares that the commission report includes nothing for promotion costs, which are always incurred and are unavoidable if creative work of this kind is to be done. Mr. Blossom discusses the other pre-construction costs mentioned in group "b" above and estimates that these 1921 combined pre-construction costs would undoubtedly run from 5 per cent to 10 per cent of the reconstruction costs of the road and that in amount they would total not less than 6 per cent of the contract costs, plus the pre-construction cost of interest on land and right-of-way, consents and damages, and of taxes on land and right-of-way.

On the cost of procuring money, he points out that this cost of financing or of securing construction money is entirely distinct from interest, and that it is underestimated, at least for 1921, in the commission's report. Such allowance must cover all brokerage and underwriting charges, the services and expenses of banking houses and of their security distributing houses, and the expenses of the company, incurred in this connection. Mr. Blossom's experience and that of his firm and of corporations with which he is connected is that the actual cost of public utility money raised by the sale of bonds of profitable going companies would run from 5 per cent to 6 per cent, while the cost of that raised by the sale of junior securities would range from 8 per cent upward. The average cost of so procuring money would certainly exceed 6 per cent and would probably be 7 per cent. These percentages are lower than would be asked for street railway securities, and especially for those of a construction enterprise. Under the conditions in 1921 of the money market, the company credit and the city authorities' attitude, the money might not have been securable even at 10 per cent or 15 per cent. In Mr. Blossom's own Brooklyn valuation figures, he takes 6 per cent as the least percentage that could properly be figured.

COMPARISON OF VALUATIONS

Company	Commission Valuation Report	Mr. Blossom's Revised Values
The Nassau Electric Railroad Company..........	$26,309,070	$34,335,707
The Coney Island and Brooklyn Railroad Company..........	13,296,492	16,815,948
Brooklyn, Queens County & Suburban Railroad Company..........	10,385,975	16,388,409
South Brooklyn Railway Company and Lessor Companies..........	8,307,528	14,322,522
The Brooklyn Heights Railroad Company.......	1,523,521	2,188,909
Coney Island & Gravesend Railway Company...	977,318	1,231,066
The Brooklyn City Railroad Company..........	45,361,243	60,914,216
	$106,161,147	$146,196,777

In discussing the next group (d) of reproduction costs, or that of the company's costs subsequent to construction, he says that the commission's report allows for floating capital as determined by the inventory of material and supplies, but includes no allowance for cash working capital, for physical property development costs, cost of experimentation or changes, nothing for expenditures made to create and develop business, and nothing for the value of power or advertising contracts or for franchise value.

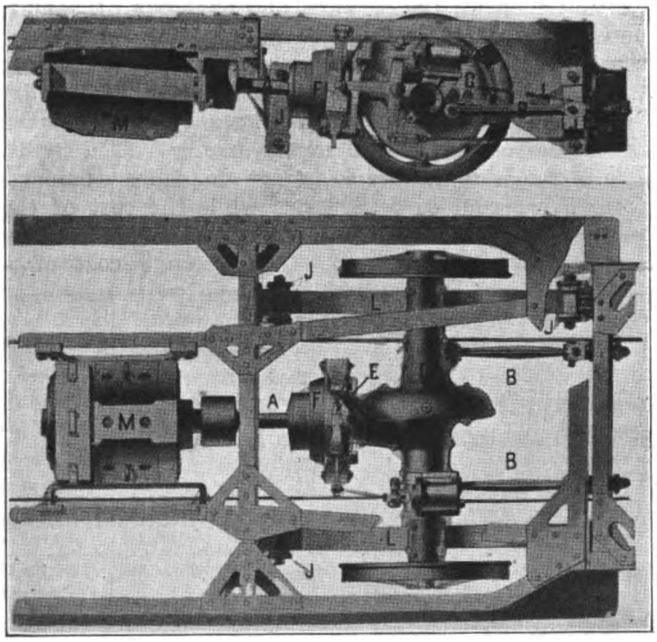
The accompanying table shows the valuations made by the Transit Commission and by Mr. Blossom.

New Light Motor Car for Paris Tramways

Unified System in French Metropolis Is Trying Out a Novel Form of Car Designed to Secure as Far as Possible the Riding Qualities and Inherent Lightness of the Automobile

IMPRESSED by the importance of reducing the weight of tramway cars and decreasing the shocks transmitted to the body, the department of studies and of technical control of the Société des Transports en Commun de la Region Parisienne has designed and constructed a sample car seating forty-nine persons and weighing 12.7 net tons. This is 519 lb. per seat, as compared with 633 lb. for the comparable type of car now in operation in Paris. The new one might be called a truckless car, as the two axles are connected through a flexible spring system to the body underframe, which carries the motors rigidly mounted. The wheelbase is 11 ft. 10 in. The car seats forty-nine passengers, and it is driven by two motors of 45-hp. each, rated on a one-hour basis. The details are shown in the accompanying illustration.

Each motor drives, through a longitudinal shaft, a bevel gear carried on the car axle. The gears are of heat-treated chrome-nickel steel. The gearing is inclosed in an oil-type casing which provides all bearings for the axle. As the gears run in oil they splash oil into the axle bearings, thus furnishing all necessary lubrication at this point.



MOTOR DRIVE AND SPRING SYSTEM OF EXPERIMENTAL CAR NOW BEING TRIED OUT IN PARIS

A—Longitudinal shaft. B—Connecting rods between axles and frame. C—Axle housing. E—Adjusting nut for brake band. F—Brake drum. J—Elastic coupling permitting side play. L—Semi-elliptic laminated springs. M—Motor.

An important feature of the design is the flexible spring suspension, combining both semi-elliptic and helical springs. These are so designed that the deflection is slightly over ⅓ in. per ton of load. The suspension provides also for lateral movement in order to prevent the transmission of sidewise shocks to the car body. To this end the connection from the semi-elliptic spring to the car underframe is made through a hanger which is itself essentially a laminated spring. This hanger, which also incloses a helical spring for vertical flexibility, is permitted a lateral movement of about 0.8 in. between stops. The maximum force tending to restore the hanger to its vertical position is about 6,600 lb. However, the body can be easily oscillated by one man pushing and pulling it sidewise.

Braking of the car is done by means of band brakes acting on drums carried on the longitudinal shafts. These can be operated either by hand or by means of small air-brake cylinders mounted on the axle housings. By this arrangement the total weight of braking equipment has been reduced from between 2,500 and 3,300 lb., as on some of the Paris cars, to less than 900 lb. These two methods of braking can be supplemented by the use of the motors, short circuited or reversed.

COMPARATIVE DATA FOR STANDARD AND EXPERIMENTAL TWO-AXLE CARS IN PARIS

Wheelbase 11 Ft. 10 In.

	Type G Motor Car (Paris System)	New Light Car
Seating capacity	49	49
Total weight, empty, tons	15.5	12.7
Unsuspended weight, tons	3.1[1]	2.1
Weight of truck and equipment, tons	3.0	0
Truck deflection per ton	0.107 in.	0
Total deflection per ton	0.214 in.	0.357 in.
Weight of body, tons	8.2[2]	9.6[3]

[1] Includes that part of the weight of the motor which is supported from the axle.
[2] Complete with underframe and equipment.
[3] Complete with underframe, motors and equipment.

By the use of this new car, G. Vergniole, of the department of studies and technical control of the T.C.R.P. Company, calculates that if all motor cars on this system could be conformed to the new model, an assumption which he says is obviously premature, there would be an annual saving of more than 9,000,000 kw.-hr. The corresponding saving in coal would be 16,500 tons. This indicates the advantage due to a reduction in weight assumed at 2.5 tons, which is much less than would actually be secured.

There is also the advantage of the reduction in unsuspended weight and insufficiently suspended weight, the effect of which is to cause wear and tear on rails, joints, track foundations and rolling stock.

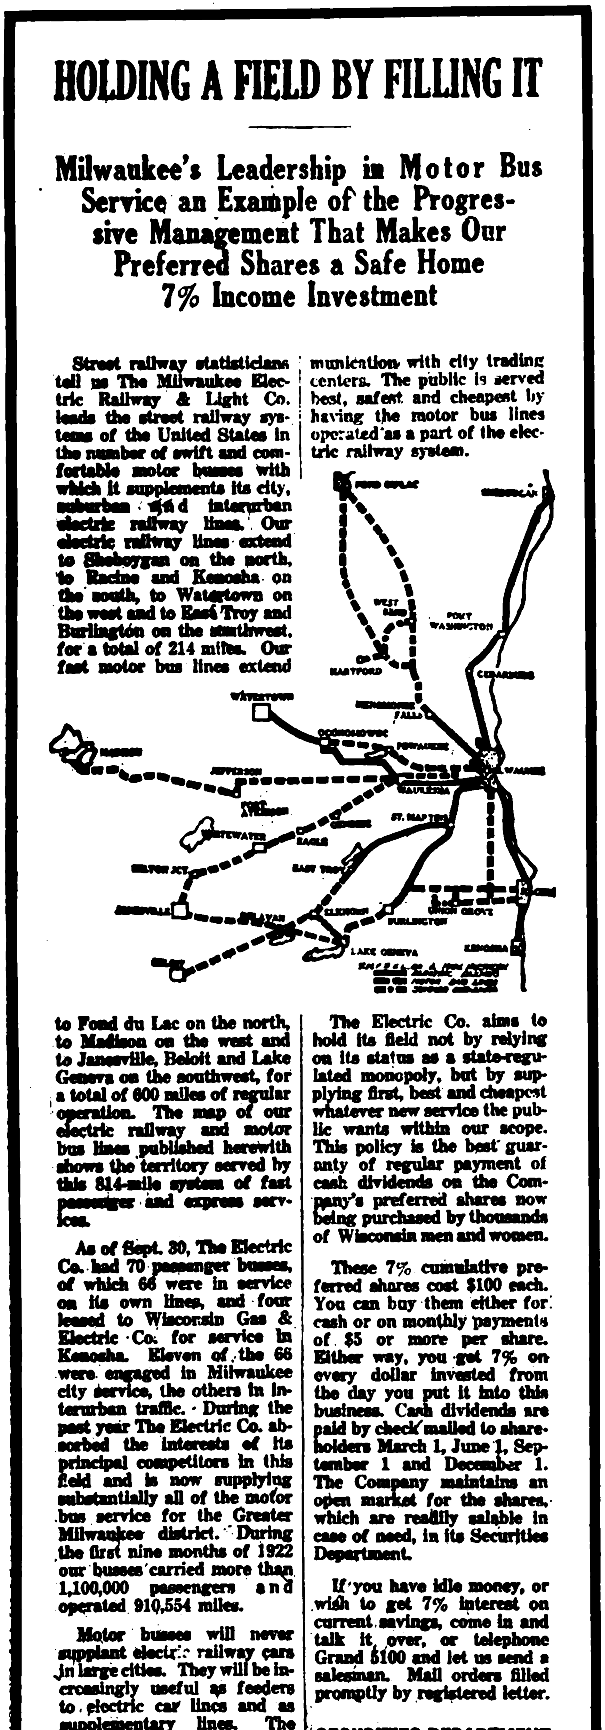
Actual tests of the new car show it to be capable of climbing a grade of 5.3 per cent with a load of more than 13 tons. Starting from rest at the foot of the grade, it reached a speed of 9 m.p.h. on the grade and under the same conditions reached about 5 m.p.h. when drawing an empty train weighing about 25 tons.

Experience with the braking equipment was remarkably satisfactory. The motor car alone was stopped on a downgrade of 2 per cent from a speed of 15 m.p.h. in less than 65 ft. With rheostat braking, arranged to limit the speed to about 6 m.p.h. on a grade of from 3 to 5 per cent, the resistance necessary was shown to be about 6 to 7 ohms.

In concluding his account of the new car, which he covered in an article in *L'Industrie des Tramways, Chemins de Fer et Transports Publics Automobiles*, Mr. Vergniole said that tramway construction has followed steam railroad models too far. Automobile construction, involving problems much more complex, has made remarkable progress in the last few years. The tramway conditions are much more nearly analagous to those of the auto-omnibus than they are to those of the railroads. It should be possible through the use of automobile technique, the employment of special steels and light metals, the perfecting of the electrical apparatus and particuarly the development of high-speed, light motors, to permit tramway cars to be built with weights comparable with those of the omnibus. In Paris the weight of tramway cars per seat is from 1.7 to 2.6 times that of a gasoline or electric omnibus.

"Holding a Field by Filling It"

An advertisement of the Milwaukee Electric Railway & Light Company which recently appeared in a Milwaukee paper is reproduced herewith. In the lines is the essence of volumes on how to finance and simultaneously better public relations. Between the lines is a significant story of one effective way of meeting bus competition.



HOLDING A FIELD BY FILLING IT

Milwaukee's Leadership in Motor Bus Service an Example of the Progressive Management That Makes Our Preferred Shares a Safe Home 7% Income Investment

Street railway statisticians tell us The Milwaukee Electric Railway & Light Co. leads the street railway systems of the United States in the number of swift and comfortable motor busses with which it supplements its city, suburban and interurban electric railway lines. Our electric railway lines extend to Sheboygan on the north, to Racine and Kenosha on the south, to Watertown on the west and to East Troy and Burlington on the southwest, for a total of 214 miles. Our fast motor bus lines extend to Fond du Lac on the north, to Madison on the west and to Janesville, Beloit and Lake Geneva on the southwest, for a total of 600 miles of regular operation. The map of our electric railway and motor bus lines published herewith shows the territory served by this 814-mile system of fast passenger and express services.

As of Sept. 30, The Electric Co. had 70 passenger busses, of which 66 were in service on its own lines, and four leased to Wisconsin Gas & Electric Co. for service in Kenosha. Eleven of the 66 were engaged in Milwaukee city service, the others in interurban traffic. During the past year The Electric Co. absorbed the interests of its principal competitors in this field and is now supplying substantially all of the motor bus service for the Greater Milwaukee district. During the first nine months of 1922 our busses carried more than 1,100,000 passengers and operated 910,554 miles.

Motor busses will never supplant electric railway cars in large cities. They will be increasingly useful as feeders to electric car lines and as supplementary lines. The motor bus has a large field, in interurban traffic, in which it will grow and prosper, affording hundreds of small communities, not served or inadequately served by railways, frequent quick communication with city trading centers. The public is served best, safest and cheapest by having the motor bus lines operated as a part of the electric railway system.

The Electric Co. aims to hold its field not by relying on its status as a state-regulated monopoly, but by supplying first, best and cheapest whatever new service the public wants within our scope. This policy is the best guaranty of regular payment of cash dividends on the Company's preferred shares now being purchased by thousands of Wisconsin men and women.

These 7% cumulative preferred shares cost $100 each. You can buy them either for cash or on monthly payments of $5 or more per share. Either way, you get 7% on every dollar invested from the day you put it into this business. Cash dividends are paid by check mailed to shareholders March 1, June 1, September 1 and December 1. The Company maintains an open market for the shares, which are readily salable in case of need, in its Securities Department.

If you have idle money, or wish to get 7% interest on current savings, come in and talk it over, or telephone Grand 5100 and let us send a salesman. Mail orders filled promptly by registered letter.

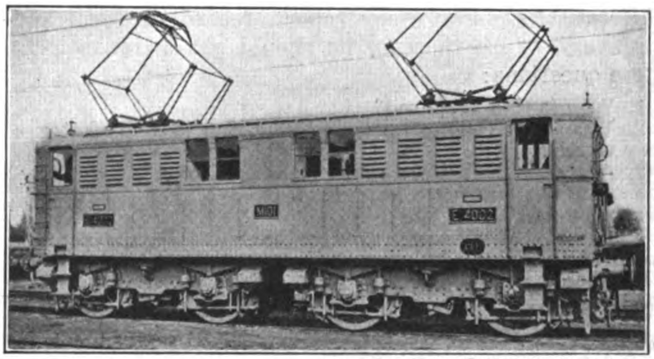
Midi Locomotive Tests Successful

First of Large Order of 1,500-Volt Direct-Current Locomotives Tested Between Pau and Lourdes on Midi System—Maximum Speed Is 60 M.p.h.

Great interest attaches to the recent track test of the first of the direct-current locomotives destined for use on the Midi Railway in France. The test was made between Pau and Lourdes, the locomotive having been built near Tarbes in southwest France by the French Electric Construction Company (Compagnie des Constructions électriques de France). It will be remembered that the Midi, previous to the war, had made investigations of the single-phase system and had under test several different makes of locomotive of this type.



©Wide World Photos

First Completed 1,500-Volt, 1,000-Hp. Locomotive for Midi Railway

The present locomotive, of which some of the details can be gathered from the accompanying illustration, is for use in freight service, local passenger service and express passenger service on heavy grades. Its weight is about 80 tons, or 20 tons per axle. Each truck carries two motors, capable of developing 250 hp. each continuously, or 350 hp. for one hour. The tractive effort is 16,500 lb. and the maximum speed is 60 m.p.h. The motors drive the axle through double-reduction gears, one set at each end of each motor shaft.

The contactors are operated mechanically through a motor-driven camshaft. The controller and contactor circuits are fed at 120 volts from a motor-generator set supplied from the 1,500-volt line. This set also supplies power for light, heat, compressor motors, etc. The group includes also an exciter generator for use while the locomotive is regenerating.

The main driving motors have forced ventilation, provided by fans, of which there is one for each truck. The fans are driven from the motor-generator set, which is located centrally in the cab on its floor. The motor-compressor groups, of which there are two, are placed at the ends of the cab.

Provision is made so that when several locomotives are used in a train in multiple-unit connection the low-tension circuits of the several groups of motor-generators can be coupled in parallel by means of special switches. The above details are taken from the issue of *le Génie Civil* for Nov. 11, 1922.

Letter to the Editors

On Statistics

FORD, BACON & DAVIS, INC.

NEW YORK, Nov. 27, 1922.

To the Editors:

The *Journal* never contained a truer or more timely word than its editorial paragraph of last week regarding the use and neglect of statistics. A rather extended opportunity for observation would lead one to believe that there is not a street railway office in the land which is not full of valueless figures, with more coming through the mill every day. The operation of a street railway is a big job and a man generally thinks he does well just to keep it running, and he is right. But he ought to set aside an hour some day to plan out an audit of his statistics. For every report, record or form and for every figure thereon, he should get an answer to these questions:

1. Why is this prepared?
2. What deductions can be drawn from it and what are they worth?
3. Are such deductions systematically drawn?
4. Are the figures right; that is, are they what they purport to be?
5. Can the form be improved so that: (a) It will be more useful? (b) It will be cheaper to prepare?
6. Does it pass under the eye of every one who can make good use of it?
7. Is it consistent with all other figures on the same subject?

It would seem that every one might agree that no figure should be prepared without a real purpose, either as a record, or to indicate efficiency and inefficiency, or to prevent inefficiency. It may be that a figure or form has value in one of these particulars, but does it have enough value to warrant the expense of preparing it and the danger of obscuring figures and deductions of undoubted value. The men who must draw the deductions are busy, so that things should come before them in as simple and vivid form as possible.

Drawing deductions from reports is a fine art. I remember a story in the *Journal* some years ago of a superintendent who came into his general manager's office highly elated because "the Smith Street Line hit 40 cents yesterday." This was in the old 5-cent fare days. The general manager said that any superintendent who let a line earn 40 cents gross revenue per car-mile ought to be fired. In the story, the superintendent had no come-back, but he might have retorted that it would depend upon the average length of haul, size of car, comparative travel in the two directions, per cent of transfers, and a few other things. Figures may not lie, but explanations of them sometimes do.

In the stress of operation, reports are often neglected. No one can get the ultimate essence of a report but the man in authority. However, he could get a lot of help down the line if he would sketch out the things he looks for and the meaning to him of the various figures. This would at least stimulate inquiry.

If figures are not right, it were better that they had never been made. Figures may be all right mathematically, and the books may balance, but if a figure is not exactly what it purports to be, it is wrong. Examination of books and records seldom fails to develop many instances of such errors. This is generally due to lack of consultation and co-operation between departments.

To make forms useful, they should answer specific questions which the man responsible for operation is always asking himself. They should throw light on every vital action or condition. In preparing a form, therefore, the man who is in charge of the work should have a large share. Failure to do this often results in the keeping of more or less private records by members of the organization who cannot get what they want through regular channels, or feel that they cannot rely on what they get.

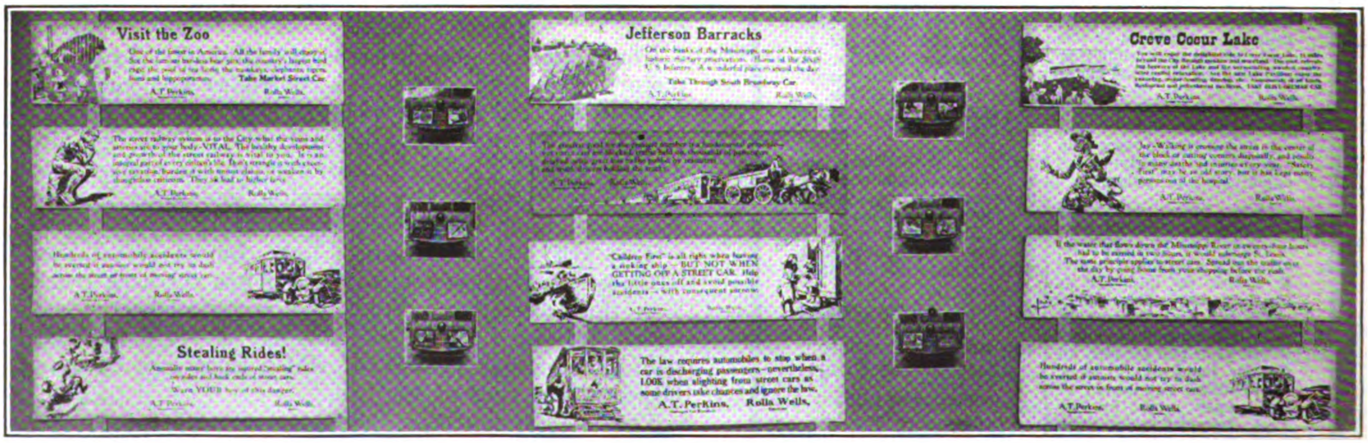
There is certainly a lot of money wasted in preparing statistics by cumbersome methods, duplications and otherwise. Clerk hire is cheap, but nothing short of 100 per cent efficiency is going to save the electric railway industry.

What is needed pretty generally is a good shaking out of dust, some intelligent analysis of cause and effect, and loyal co-operation between the people who use the figures and the people who make them.

If we should clean house, it may be that some of the commissions would see their way clear to simplifying their requirements in the way of statistics.

J. A. EMERY.

How the United Railways of St. Louis Keeps Its Public Informed



TRAFFIC-CREATING POSTERS DISPLAYED BY THE UNITED RAILWAYS, ST. LOUIS, MO., AT THE CHICAGO CONVENTION OF THE AMERICAN ELECTRIC RAILWAY ASSOCIATION. THESE HAVE BEEN APPEARING FROM TIME TO TIME ON THE COMPANY'S CARS

Use of One-Man Cars in Europe Spreading*

Operation with Short Cars Has Been Satisfactory and Some Long Cars Will Be Converted—Due to Customs in Europe Some Loading Difficulties Have Been Encountered, But These Are Gradually Being Overcome

BY P. M. NIEUWENHUIS
Manager of the
Arnhem Municipal Tramways

AFTER an extended study of the operation of safety cars in the United States, the writer recommended their trial to the City Council of Arnhem. The motive for the use of these cars in Arnhem was economic. On account of the increase in cost of labor, reduction in working hours, etc., the cost of operation per car-kilometer had increased from 14½ cents (Holland) in 1914 to 51 cents in 1920, although the fare had increased only from 7½ cents to 10 cents on the city lines and from 15 cents to 20 cents per trip on the suburban lines. It is not thought practicable to increase this fare or to make other economies in operation. The former headway in the city was ten minutes, reduced later to seven and a half minutes, and on the suburban lines was from ten to fifteen minutes. It was estimated that the cost of platform labor per car per year with two men, including wages, pensions, substitutes during the permitted vacation with pay for twelve days of the year, accident insurance, etc., was about 6,000 florins a year. The average number of hours worked by the men per day is seven hours and twenty minutes. The existence of a uniform fare on the suburban lines made the introduction of the American system of one-man car particularly easy, especially as during the rush hours a good many passengers ride on passes or commutation tickets, which it was necessary only to show to the operator.

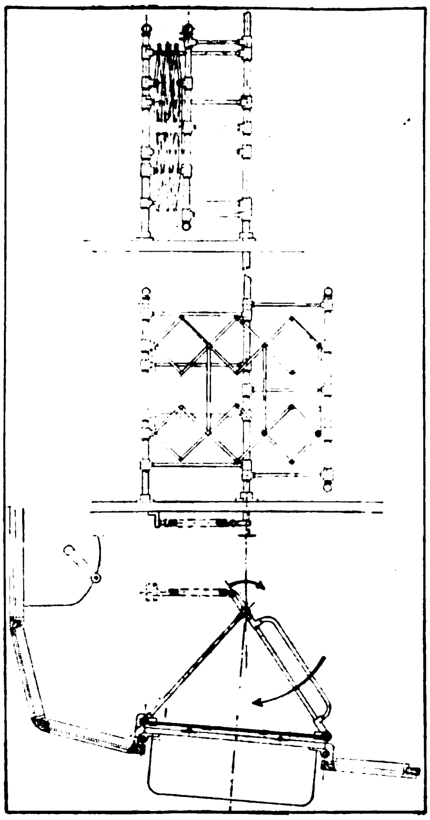
Three one-man safety cars were ordered from a Philadelphia car builder, but the standard design of Birney car had to be somewhat modified because the limit in width was 2.2 meters (7 ft. 2½ in.). These cars had not been received at the time the paper was written. It was also decided to rebuild some existing short cars for one-man operation, though, for reasons of cost, it was considered undesirable to install air brakes and pneumatic equipment for doors and steps, and manual control was used.

The design adopted was based somewhat on that used in Chicago on two-man cars, as observed by the writer.

The car is also supplied with push buttons.

COLLECTION OF FARES

On the one-man cars, of which we now have several, we have only the uniform fare of 10 cents, which entitles a passenger to a transfer. We do not use a fare box, but the operator carries one or two bundles, each consisting of 250 tickets, on which are indicated the date and the hour of issue, and a different color is used for each line. This ticket also serves as a transfer and on the second car is cancelled by having the end torn off. We looked into the subject of fare boxes and transfer issuing machines, but as we needed only a small number of the transfer issuing machines, the builder did not feel that it was worth while to modify his designs to fit the smaller transfer ticket which we wanted to use. As regards the fare box, my own opinion is that the ticket system which we are now using is simpler, but that is a matter of personal opinion only. I realize that fare boxes have been operated for some time with very satisfactory results at Haarlem. Finally we put in a stool for the operator to sit on.



AUTOMATICALLY CLOSING PANTOGRAPH GATE FOR EXIT ON ONE-MAN CARS AT ARNHEM

Having got good results with three rebuilt cars, we decided to change over to one-man operation all of our motor cars of the smaller types, or those with room for eighteen seated passengers and fourteen standing passengers. With these cars we were able to cut down headway in the city from ten minutes to seven and a half minutes, though employing a smaller number of men. In general the service has been entirely satisfactory.

The lines in Arnhem all terminate in a central square (Willemsplein) where the cars stop for a minute or two to permit passengers to change cars, but there has been no appreciable delay at this point, in spite of the large number of people transferring. Operating speeds have not been increased for these cars.

It must be admitted that there has been some delay in loading and some public dissatisfaction therewith. There will be, for instance, a woman returning from the market and carrying as many bundles as a Christmas tree who will mount the platform without the fare in her hand. She will then have to deposit her bundles on the platform, make a search for her pocketbook, which perhaps she can find and perhaps not in the place where she thought it was, then after paying her fare resume possession of her bundles. Then there is the man about town who will jump on the platform and pass quickly to his seat, cigar in mouth (we are in Holland you must remember) and become absorbed in the landscape until the operator touches him on the shoulder and reminds him he has not paid his fare. Then he has to take off his gloves, unbutton his coat, and so on. Fortunately the public is not composed in great part of such individuals.

I arranged with a newspaper man to study the situation, and he reported to me as a result of an inquiry that the public had already become accustomed to the change and he thought that it was a matter of time only that these delays would disappear. Already we are finding that the public is becoming accustomed to having the exact change, and it may be that at least in Holland we can enforce a rule that persons not so supplied will be refused passage.

In the old type two-man cars the public entered by the rear platform and left by the front platform. It is my opinion that only small sized one-man cars, or those capable of carrying from thirty-two to forty passengers, can use the same platform for entering and leaving. As soon as we change our larger cars (which seat twenty-four passengers and have standing room for twenty-five) to one-man operation, the passengers will have to enter by the front platform and leave by the rear.

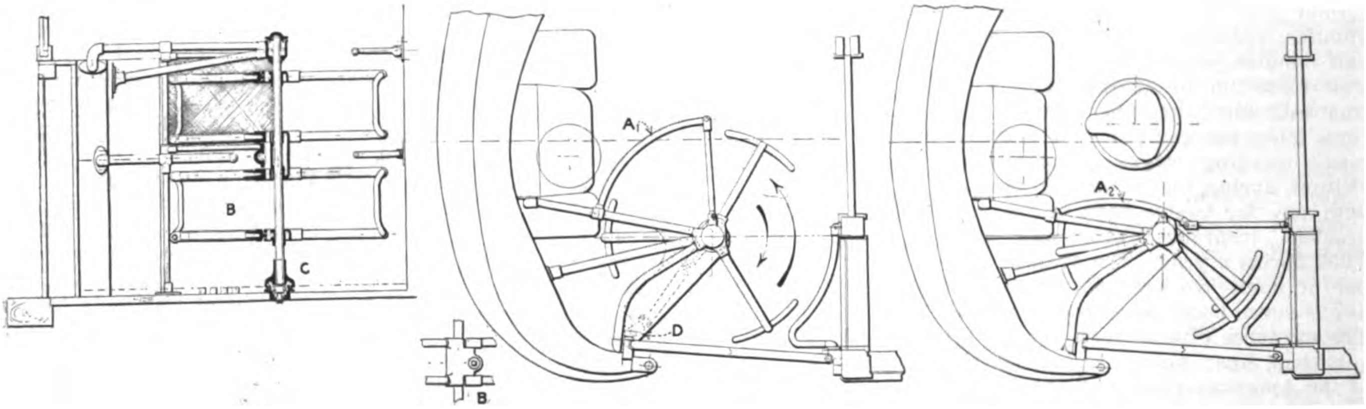
This will make necessary the use of some device which will prevent passengers entering by the rear platform without paying fare. Two types of apparatus have been designed.

The first drawing shows a form of pantograph gate which takes relatively very little room on the platform, although it permits the rapid exit of passengers. At the same time the entrance of passengers is very difficult. The device consists of a V-shaped pipe framework on the platform with a pantograph barrier extending across the exit opening. The pipe barrier consists of two members, one of which is stationary and the other swings so as to provide the opening exit. The latter member is provided with a handle for the convenience of the passenger when leaving the car, as shown in the plan view. The swinging member, or gate, is normally held in the closed position, as shown in the plan, by means of a spring which operates on a bell crank lever fastened to the bottom of the rotating member underneath the car platform. To open the gate the passenger takes hold of the handle which is latched and swings the gate forward into the position shown at the top in the engraving. This movement folds the pantograph gate out of the way, leaving a passage wide enough for one passenger only. As soon as the passenger gets off the step the gate automatically closes.

---

*Abstract of paper read at convention of Union International de Tramways, de Chemins de fer d'Intérêt local et de Transports Publics Automobiles. Brussels, Oct. 2-6, 1922.

One objection to this gate is that a passenger who is leaving the car by the rear platform may hold the gate open to permit another passenger to get on the car, but this probably would happen very rarely, because by a mirror the motorman can see everything that is going on. However, the company has also designed a different type of barrier in the form of a turnstile for possible use.



Folding Turnstile for Exit on One-Man Cars at Arnhem

The turnstile used is of a three-arm type and a particular feature lies in the fact that one of the arms can be folded in out of the way. This is of advantage at the operating end of the car, as it provides space for the operator which otherwise would be taken up by the turnstile. Another interesting detail is in connection with the pipe framework barriers. When the turnstile is used for the exit of passengers, a bracket arm shown at A_1 in the accompanying drawing projects out and is connected to the center of the turnstile by an arm. At the operating end of the car this arm can be unhooked from the center post and folded into the position shown in A-2. This effectually closes off the opening and at the same time provides additional space for the operator.

Zone Fare Not an Impediment

In introducing his paper Mr. Nieuwenhuis explained that before the adoption of the one-man car in Arnhem, he had made a trip to the United States in February, 1921, where he had made a special study of the one-man safety car. Although a little skeptical as to the conditions which he had read about in the American technical papers, he found on his arrival that he had not been deceived. In this case, Americans, always audacious in their enterprises, had taken the bull by the horns, and by the one-man car had been able practically to reduce the platform costs by half, with the same mileage. To do this in Holland would mean a saving of about 40 francs per motor car day.

Continuing, the speaker said he presumed many railway men would doubt the practicability of introducing the system in their own localities. Public opinion, they would say, would not stand for it, but are the European populations less civilized or less disciplined than those in America? In Arnhem, which has 80,000 inhabitants, and is the center of an agricultural district, the community has accepted the change with good grace. It is possible that in a more industrial locality, more hostility would be shown at first, but in the speaker's opinion everything depends on the way in which the system is introduced to the community and the preliminary educational work done.

Another objection raised to the system is that in most of the European cities the zone system is used; this means the distribution of a large number of fare receipts of different values, and the issuance of these fare receipts takes time and would increase the length of stops. This did not seem an insuperable objection to the speaker, since the fare system if complicated could be simplified. Certainly some effort is worth while to secure such an important saving. Mr. Nieuwenhuis then presented his report, of which an abstract has just been given.

New International Railway Association Organized

AN INTERNATIONAL railway conference was held recently in Paris, where the permanent headquarters of a new organization, the Union Internationale des Chemins de Fer, will be located. The organization has been formed for the purpose of facilitating international trade and traffic, and it includes Germany, as well as Japan and China. The official language will be French, and it is expected that a general meeting of the association will be held every five years.

Canadian Association to Meet in Toronto

SECRETARY D. N. GILL of the Canadian Electric Railway Association has sent to the membership a report of the executive and general meetings held in connection with the American Electric Railway Association convention at Chicago. It was decided to hold the 1923 convention at Toronto some time during the summer. It was suggested also that, as many Canadians are members of the American Electric Railway Association, a general meeting of the Canadian Association should be held each year during the convention of the former.

The secretary reported the appointment of the following permanent committees: On public relations—A. W. McLimont, Winnipeg, chairman; Max A. Pooler, St. John; E. W. Oliver, Toronto; George Kidd, Vancouver, and W. J. Lynch, Quebec. On standards—G. Gordon Gale, Hull, chairman; D. E. Blair, Montreal; E. P. Coleman, Hamilton; C. C. Curtis, Sydney; W. G. Murrin, Vancouver; H. T. Gibbs, Toronto; W. G. Gordon, Toronto, and Hugh Millar, Montreal. On safety—J. F. H. Wyse, Toronto, chairman; R. M. Reade, Quebec; C. C. Curtis, Sydney; W. R. McRae, Toronto; W. H. Darracott, Winnipeg, and James Lightbody, Vancouver.

H. E. Weyman, Levis, was appointed chairman of a committee which is to report on the advisability of representing to the dominion government certain changes in the classification of accounts and also on proper accounting for maintenance and depreciation of electric railway properties.

The secretary announced that the interests of the electric railway industry in Canada at the dominion and provincial capitals are being looked after by the following: Dominion—F. G. Burpee, Ottawa; Ontario—C. L. Wilson, Toronto; Quebec—W. J. Lynch; New Brunswick—J. A. Olive, St. John; Nova Scotia—W. L. Weston, Halifax; Manitoba—Edward Anderson, Winnipeg; Saskatchewan—D. W. Houston, Regina; Alberta—M. Freeman, Lethbridge, and British Columbia—V. Laursen, Vancouver.

Kentucky Association to Meet at University

THE Kentucky Association of Public Utilities has accepted the invitation of President Frank L. McVey of the University of Kentucky to hold its 1922 annual meeting at the university. The meeting will be held, therefore, at Lexington on Dec. 12. The four utility companies operated in Lexington will tender a dinner on the evening of Dec. 11 to the delegates and guests. On Dec. 12 the meeting will convene at 9 a.m. at the Phoenix Hotel, where there will be preliminary exercises. At 11 a.m. the delegates will board special cars of the Kentucky Traction & Terminal Company for transportation to the university, where at 11:30 the meeting will reconvene in joint session with the student body in the chapel.

At the close of the morning session an inspection of the grounds and buildings of the university will be made, followed by a luncheon and further inspection. At 2:30 p.m. the meeting will be held in Mechanical Hall on the campus.

New List of International Tramway Association Officers and Directors

THE Union Internationale de Tramways, de Chemins de fer d'Intérêt local et de Transports Publics Automobiles has announced the complete list of officers and committee members, as follows: Honorary president, Baron Janssen, vice-governor of the Société Générale de Belgique, Brussels; president, C. de Burlet, Brussels; vice-presidents, H. Géron, Brussels, and G. Pavie, Paris; directors J. F. S. Barth, Christiania; L. Boulle, Paris; H. Caufriez, Brussels; Marquis de Foronda, Barcelona; F. de Lancker, Brussels; W. Gerlicz, Lodz; J. Kessels, Brussels; F. Level, Paris; A. Mariage, Paris; Commander A. Natoli la Mantéa, Palermo; Kai Norregaard, Copenhagen; Ch. Rochat, Geneva; G. Salvadori, Turin; Ch. Thonet, Liége, and J. W. van der Vegt, Rotterdam.

Safety Code Revision Under Way

ON NOV. 2 there was held in New York City a meeting of the sectional committee of the American Engineering Standards Committee to consider possible revision of Section 2 of the National Electrical Safety Code. The proceedings were largely in the nature of organization. Dr. M. G. Lloyd, United States Bureau of Standards, was elected chairman; C. B. Hayden, of the Wisconsin Railroad Commission, vice-chairman, and Roy C. Dwyer, of the Bureau of Standards, secretary. It was decided that an executive committee consisting of these three officers and one representative each of the several interests represented should constitute the working body.

The executive committee will be made up as follows: Officers mentioned, and Thomas Sproule, Newark, N. J., representing National Electric Light Association; K. L. Wilkinson, New York City, American Telephone & Telegraph Company; Charles Rufus Harte, New Haven, Conn., American Electric Railway Association; George Gibbs, New York City, American Railway Association; A. E. Knowlton, Yale University, New Haven, Conn., Public Utilities Commission of Connecticut; R. A. Bloomsburg, New York City, National Association of Mutual Casualty Companies; R. A. Smith, Norfolk, Va., International Association of Municipal Electricians; R. W. E. Moore, East Pittsburgh, Pa., National Safety Council; Charles H. Gantz, Hamilton, Md., United States Department of Labor.

After consideration of a number of suggestions made by the main committee, the sub-committee adjourned to meet in Washington on Nov. 27.

Transit Expert Reviews Situation Abroad

D. L. Turner, of New York Transit Commission on Recent Trip Abroad Was Impressed by the Relation Between Size of Buildings and City Transportation Problems

AT A MEETING of the New York Chapter of the American Association of Engineers, held at the Hotel McAlpin, New York City, on Nov. 14, the speaker was Daniel L. Turner, consulting engineer of the New York Transit Commission. Mr. Turner had recently visited Glasgow, Liverpool, Edinburgh, London, Berlin, Paris, and other cities in Great Britain and on the Continent. He gave statistics of track mileage and the riding habits in a number of cities, together with running comments on his observations of electric railway construction and operating methods, including the allied subject of buses.

Contrasting conditions in New York City with those abroad, he said that the terrific congestion due to the construction of very high buildings, which threatened to make transportation an impossible problem in New York in a few years, is absent in the foreign cities. In the latter, five-story buildings are considered plenty high enough in the business districts, with the result that the traffic offered by the occupants of these buildings is fairly well distributed.

In Liverpool, said Mr. Turner, there is subway and surface transportation, with a few buses, with little belief in the usefulness of the last named. The great development there is in the direction of "arterial ways," which are wide highways with provision for tramways in the center. On these highways the cars can make such good speed as to bring them into the class of rapid transit.

Glasgow, wth 500 miles of single track, is much overbuilt from the tramway standpoint. Frequent service is given, with the result that the traffic at one time exceeded 500 rides per capita per annum. Fares are collected on the zone system, nearly 60 per cent of the passengers paying the minimum fare of 1½ cents. The municipality manufactures its own cars, under individual contracts with the workmen, and paints them different colors for the several routes. The property is in excellent condition and has reduced its indebtedness to $1,500,000, after paying which the city will own the property free of encumbrance. The manager, James Dalrymple, is buying in small lines for the city, and expects to electrify a seven-mile subway which is now operated by cable.

Edinburgh presented little of interest from the transit standpoint, as it is now being changed over from cable operation to the overhead trolley. There was great difficulty in bringing the citizens around to approve this change, but the changeover will soon be complete.

In London Mr. Turner was impressed by the fact that there is no competition between the buses and the rapid-transit lines, which serve different districts. The London County Council operates surface cars but is not permitted in the center of the city, where buses handle all surface traffic. A dozen or more different companies operate the rapid-transit lines. The buses work in well with the general transportation system of the city.

The London buses seem to be almost innumerable, and they follow many routes. It is, however, very easy to get around with their aid, as the routes are convenient and the buses are plainly marked with route signs.

One thing about London transportation is the alacrity with which passengers board and alight from the cars. They are expected to be prompt and not get hurt. Crowds of people desiring transportation are much more amenable to reason and control than in this country. Their reasonableness is shown further in the fact that they do not demand all-night transportation.

On the Continent Mr. Turner found conditions interesting, but with few features of great novelty. In Greater Berlin, which was formed in 1920, there are few rapid-transit facilities in the new sections. Much traffic is handled by the Stadtbahn, which is steam operated. The Ringbahn, a suburban system, carried considerable traffic, but rapid transit is not considered important and involves but 12 per cent of the total traffic. Six-car trains are the maximum. Eighty-five per cent of all traffic in the city is carried on the tramways, buses being very little used. Train operation is common, this plan being preferred to that of providing a large number of places per operating unit by the use of the double-deck plan which is common in England. The zone fare seems to be operating satisfactorily.

American Association News

Committee Appointments for 1922-1923

PRESIDENT C. D. EMMONS of the American Association and the presidents of the affiliated associations have completed their committee appointments for the current association year. These are listed below. These committees have already begun to function, the first meetings having been held in New York City last week.

American Association

Finance

J. H. Pardee, president J. G. White Management Corporation, New York, N. Y., chairman.
R. P. Stevens, New York, N. Y.
J. G. Barry, Schenectady, N. Y.

Policy

Britton I. Budd, president Metropolitan West Side Elevated Railway, Chicago, Ill., chairman.
J. P. Barnes, Louisville, Ky.
H. G. Bradlee, Boston, Mass.
H. E. Chubbuck, Peoria, Ill.
W. H. Sawyer, East St. Louis, Ill.
Paul Shoup, San Francisco, Calif.
H. D. Shute, East Pittsburgh, Pa.
J. J. Stanley, Cleveland, Ohio.
L. S. Storrs, New Haven, Conn.
Robert I. Todd, Indianapolis, Ind.

National Relations

Charles L. Henry, president Indianapolis & Cincinnati Traction Company, Indianapolis, Ind., chairman.
W. R. Alberger, Oakland, Calif.
P. S. Arkwright, Atlanta, Ga.
H. G. Bradlee, Boston, Mass.
Arthur W. Brady, Anderson, Ind.
C. D. Cass, Waterloo, Iowa.
F. C. Chambers, Des Moines, Iowa.
B. C. Cobb, New York, N. Y.
S. M. Curwen, Philadelphia, Pa.
J. H. Hanna, Washington, D. C.
T. N. McCarter, Newark, N. J.
John W. Shartel, Oklahoma City, Okla.
H. B. Weatherwax, Albany, N. Y.

Subjects and Meetings

J. N. Shannahan, president Newport News & Hampton Railway, Gas and Electric Company, Hampton, Va., chairman.
W. R. Alberger, Oakland, Calif.
H. V. Bozell, New York, N. Y.
Harlow C. Clark, Newark, N. J.
L. C. Datz, Memphis, Tenn.
C. R. Ellicott, New York, N. Y.
Edwin Gruhl, New York, N. Y.
W. F. Ham, Washington, D. C.
G. H. Harries, Chicago, Ill.
Henry R. Hayes, New York, N. Y.
W. V. Hill, San Francisco, Calif.
J. E. Hutcheson, Montreal, Can.

Paul E. Wilson, Cleveland, Ohio.

Camden Section Elects Officers

AT THE OCTOBER meeting of the Public Service Railway, Southern Division, company section, the following were elected to serve for the coming year: President, C. V. Wallace; vice-president, W. H. Wright; secretary, George C. Stoll; treasurer, P. O'Connor; directors, Hamilton C. Wonderly and Robert A. McArthur. Martin Schreiber, manager of the division, related some Chicago convention experiences, stating that he noted a spirit of optimism that has been missing at recent conventions.

In the general discussion one speaker referred to the possibility of using water on slippery rails instead of sand. He stated that this is being done in Liverpool, England. The discussion covered a number of practical points in connection with the daily operation of the system.

"Aera" Subscription Price

MENTION was made in the report of the executive committee meeting in last week's issue of this paper that an increase in the subscription rate to *Aera* was planned. Secretary Welsh has called attention to the fact that this is in error, and that no increase in the subscription rate to individuals is now contemplated.

Committee on National Relations Organizes

ANOTHER of the committees to meet early in the association year was that on national relations, of which Charles L. Henry, Indianapolis, Ind., is chairman. This committee met in New York City on Nov. 24 and discussed its work in a general way. No definite program was outlined, but a review of the situation of the electric railways in so far as they are affected by national legislation was taken. Besides the chairman there were present F. C. Chambers, Des Moines, Iowa; B. C. Cobb, New York City; S. M. Curwen, Philadelphia, Pa.; J. H. Hanna, Washington, D. C., and H. B. Weatherwax, Albany, N. Y.

Association Information and Service

THE American Association office announces the following additions to and revision of its service bulletins. These are available to all members of the association in good standing.

Public utility laws—A summary of the laws creating state public utility commissions, giving an analytical digest of the main provisions covering their jurisdiction and laws of the transportation companies. This is the seventh installment of the compilation which was begun in June.

Interurban wage agreements—An analysis of the agreements now in effect on the lines of twelve large interurban companies, showing in comparative form the provisions of each agreement.

Relief from paving burdens—A review of recent developments in the movement to obtain relief from municipal requirements to repave and maintain the pavement along electric railway tracks, with accounts of the leading cases which have recently been decided.

Automobile transportation costs—Some figures on costs of automobile operation in both passenger and freight services. Contains report of the Fifth Avenue Coach Company for the year ended June 30, 1922.

Trend of materials prices—A new edition of the association's compilation bringing down to date the trend of prices of materials used by the electric railways, as furnished by the manufacturers.

In addition to the above, supplements to the association's fare bulletin, wage bulletin and cost of living studies have been prepared, bringing them down to date.

Safety Experts to Study Automobile Accidents

ONE of the first, if not the first, of the newly appointed committees to organize and meet was the committee on accident prevention of the Transportation & Traffic Association. This met in New York City on Nov. 24 with Chairman H. B. Potter, Boston, Mass., in the chair. Other members present were H. O. Allison, New Brighton, Pa.; M. W. Bridges, Chicago, Ill.; C. W. Chase, Gary, Ind.; A. W. Koehler, Rochester, N. Y.; C. E. Morgan, Brooklyn, N. Y.; C. E. Mulford, Richmond, Va.; J. V. Sullivan, Chicago, Ill.; and E. M. Walker, Terre Haute, Ind. President G. T. Seely, of the T. & T. Association, also attended for part of the meeting.

After general discussion a sub-committee was appointed to draft a questionnaire asking for reports on different classes of accidents, particularly collisions with vehicles, derailments, car collisions, boarding and alighting accidents (for open and closed cars separately) and personal collisions. This committee will consist of Messrs. Bridges, Chase, Koehler, Boyce, Sullivan and Potter. It was also decided to have this committee co-operate with the corresponding committee of the Claims Association.

A second sub-committee was next appointed to prepare a compilation of methods of handling accident-prevention problems. The investigation will include plans for co-operating with civic and other bodies. The committee will comprise Messrs. Walker, Morgan, Reade, Warren and Harmon.

The following were appointed as a committee to co-operate with the American Association Committee of One Hundred (through Labert St. Clair), in regard to the preparation of safety posters which are to be distributed free to all electric railways in the United States. The appointees were: Messrs. Potter, Allison, Morgan, Sullivan and Walker.

Mr. Potter urged strongly the giving up of such outworn slogans as "Safety First," "Watch Your Step," etc., and recommended that new ones be formulated. One of the recent epigrams which had struck his fancy was: "Any accident may be fatal."

Mr. Seely addressed the committee, stating that it has a free hand to develop its subject, which is one of the most important ones at present in connection with the welfare of the industry. The situation is so alarming that anything that can be done to assist electric railways in reducing accident costs will be greatly appreciated.

Recent Happenings in Great Britain

London Underground Railways' New Capital, Extensions and Fare Reductions—Electrification of Southern Railways—More Time Saving

(From Our British News Representative)

ON OCT. 18 a prospectus was issued inviting subscriptions for additional capital to the amount of £3,958,000 for three of the London underground electric railway companies. Three days later it was announced that the issue was oversubscribed and that lists were closed. The rapidity of subscription was no doubt due to the fact that the new capital is guaranteed by the state both as to principal and interest under the trade facilities act of 1921. The issue was the second and final portion of the total guaranteed by the government.

In June last redeemable second debenture stock was put on the market at the price of 94 per cent by the London Electric Railway to the extent of £1,000,000 and by the City and South London Railway to the extent of £1,500,000. The present issue is of £2,250,000 of 4½ per cent redeemable second debenture stock in the case of the London Electric, £1,250,000 of the same denomination of stock for the City and South London, and £458,000 of 4½ per cent redeemable debenture stock of the Central London Railway, all dated 1942-72, and all at the issue price of 93 per cent. The stocks are of course trustee securities.

The new works to be carried out, some of which have already been begun, include the widening of the tunnels of the City and South London Railway, the construction of a connecting "tube" line between the railway at Euston and the Charing Cross and Hampstead Railway at Camdentown, the building of a surface continuation on the latter railway from Golder's Green to Edgware, the construction of an extension of the Great Northern & Piccadilly railway from Hammersmith to a junction with a branch of the London & South Western Railway, the provision of additional rolling stock, the improvement of stations and the substitution of escalators for lifts at a number of stations. These works will, among other things, enable through trains to be run from Edgmore in the north to Clapham in the south, and from Finsbury Park in the north to Richmond in the southwest, thus greatly adding to public facilities. Meantime work will be afforded to thousands of men, and it may be recalled that the object of passing the grade facilities act was to promote employment for the workless on undertakings of permanent public utility.

London Fares Reductions

The London underground railway companies have announced that a scheme of reductions in force will be put into operation on Jan. 1, 1923. The minimum 1½d. fare will be retained, but fares above that amount will be reduced to an approximate rate of 1d. per mile up to 4d., and thereafter the distances given for all fares above 4d. will be increased. This, it is hoped, will encourage the longer-distance traffic and help to build up the outer suburbs.

As under the London electric railways fares act, 1920, workmen's return fares are the single ordinary fares for the double journey, workmen will benefit correspondingly with the reduction in ordinary fares. The minimum return workman's fare, however, remains at 3d. Season ticket rates will be lowered in proportion to ordinary fares. Over all, the reductions affect one-third of the railway fares. The companies have in the past not charged up to their full statutory powers on the average, and when the reductions are carried out they will be charging less on the average than 1d. per mile.

Of course the companies hope that increased traffic will be a result of the reductions. Expenses have not yet fallen sufficiently to warrant wholly the present concessions. The cost of carrying a passenger for the first nine months of 1922 compared with the first nine months of 1921 shows a reduction of only three-tenths.

The Southern Railway Amalgamation

By the railways act of 1921 it was provided, inter alia, that all the steam railway companies of Great Britain should be combined into four great companies, and that work of amalgamation is now in progress. In regard to what is called the southern group, there is an interest for readers of this journal, because two out of the three railways to form the group, the London & South Western and the London, Brighton & South Coast Railways, already use electric traction on their London suburban lines, and the third, the South Eastern & Chatham Railway, proposes to adopt the same method on its suburban routes. Toward the end of October it was announced that these companies had at last agreed on the terms on which they will form the southern group.

The new amalgamated company will issue its stocks in exchange for those of the existing companies, and its capital will be £144,846,000. It does not seem to be anticipated that there will be much trouble in arranging for the running of through electric trains between the three hitherto existing undertakings should it be found desirable. At the same time it may be noted that the London & South Western uses direct current at 600 volts on a third-rail conductor, that the London & Brighton works on the single-phase high-tension system with overhead wires, and that the South Eastern & Chatham contemplates the use of high-tension direct current.

Speed in "Booking"

On the New York underground railways, where I believe a uniform fare for any distance prevails, the question of speed in issuing tickets (here called "booking") to passengers cannot present the same difficulty as it does on the London underground railways, where the fares are in proportion to distance to be traveled. As local city railways are extended, however, the necessity for graduated fares, even in America, becomes more acute, so that the following details supplied officially to me by the London underground railway companies may be of interest. It may be remarked that the comparison between the issuing of tickets by hand and by booking machine shows such an extraordinary efficiency and smartness on the part of the booking clerk that he ought to have substantial promotion.

The figures also indicate that if there are many booking clerks like him there is no material advantage in using a booking machine.

The test was taken during the heavy rush hour of 5:30 to 6:30 p.m. At Piccadilly Circus Station of the "Underground" during the hour a booking clerk issued by hand 809 tickets. Out of the number of passengers, 441 required change, the details being: Nine required ½d. change; three required change for 3d.; 157 needed change for 6d.; 130, change for 1s.; 85, change for 2s.; 51, change for 2s. 6d., and six, change for 10s. At Oxford Circus Station, by means of an electrically operated booking machine, between 5:30 and 6:30 p.m. a booking clerk issued 872 tickets.

During that time he was delayed in answering four inquiries for season tickets and in supplying from the emergency ticket rack six ordinary tickets which the machine was unable to meet. The machine delivers the change as well as the tickets.

Edinburgh Conversion

A remarkably smart bit of work was carried out by the Edinburgh tramway department in the early morning hours of Sunday, Oct. 22, in connection with the conversion of the lines from cable to electric traction. Up to midnight on Saturday, Oct. 21, cable cars were running in Princes Street, the great central thoroughfare of the city. At half-past nine o'clock on Sunday morning the first electric car ran over the route, which is about a mile long. All the work which could be done beforehand had of course been carried out. Squads of men, numbering in all about 300, were put on at several points about midnight to adjust the tracks and to erect the center poles and trolley wires. By Sunday evening a complete Princes Street service of cars was in operation by electric traction.

Service Complaint Filed

International Blames Inability of New Men—Local Service Restored in Lockport, "Owl" in Buffalo

Traffic experts of the Public Service Commission are making a survey of service on the local lines of the International Railway, Buffalo, N. Y., as a result of an appeal to the municipal authorities for improved service. City authorities have served notice on the company that cars must be operated with more regularity.

Herbert G. Tulley, president of the International, says the company has more than sufficient men to operate its local and interurban cars, but since the so-called Philadelphia vacationists have returned home, the new men being employed by the company have given considerable trouble. The claims department of the railway company has many accident and claims investigations under way.

The City Council unanimously adopted a resolution demanding that all the cars operated on the local lines of the International be equipped with life guards, emergency brakes and rear exits and crews must report all accidents to the police. This resolution was made necessary because of the increasing number of traffic accidents. The International did not appear in opposition to the proposed resolution. It is the company's contention that the city is without such authority as the Public Service Commission only has jurisdiction.

The activities of the claims department of the International and the Philadelphia Rapid Transit Company officers who have been detailed to strike duty in Buffalo are confined almost exclusively to getting evidence against jitney owners and drivers and arresting them. Several arrests are made daily and fines of $25 to $50 are imposed by the City Court Judges. The City Court calendar is now so congested with jitney cases demanding jury trials that it will keep many of the judges busy until next April hearing the evidence.

The International Railway has taken an appeal from the decision of the Appellate Division of the Supreme Court which upset the writ of mandamus obtained by the railway to compel Mayor Schwab to enforce the anti-jitney laws. The case now has been carried to the New York State Court of Appeals.

Local service on the Lockport lines of the International was restored Nov. 25. The city had been without local service since the start of the strike, July 1. Three days after service was restored Edgar J. Dickson, vice-president of the International, stated that riding was 50 per cent of normal, with little or no disorder by the strikers.

Half-hour "owl" service has been restored by the company on many of the local lines of the International in Buffalo. Other lines with no "owl" service since the strike are now operating on an hourly basis.

Police Chief Elliott of the city of Tonawanda has served notice on the International that cars run on lines within the city limits must not operate at a greater speed than 8 miles an hour. The action follows a vote by the Board of Aldermen, which is the result of the increasing number of accidents. The order affects the old Buffalo-Niagara Falls interurban line and the Buffalo-Kenmore-Gratwick line.

Will Spend $550,000 in 1923

The Virginia Railway & Power Company and the City of Petersburg, Va., will spend approximately $550,000 in 1923 in improvements and betterments. The improvement work includes new paving work, new tracks, a trackless trolley for Walnut Hill and the extension and enlargement of Petersburg hydro-electric development. The paving will cost about $150,000 and the new tracks and power plant will cost the company approximately $400,000.

The railway service will continue in the city as the Council rejected the trollibus proposal but the system will be operated in Walnut Hill. Two of the trackless trolley cars have already been ordered and probably will be in Petersburg by Jan. 1, 1923.

Bill Provides for Electrification

William J. MacDonald, a Boston real estate operator, recently filed with clerk of the House a bill authorizing the incorporation of the Boston Rapid Transit Company, for the purpose of financing the electrification of the railroads entering the north and south stations, for the construction of a union station in the Back Bay district and for authority to construct tunnels to connect the two leading stations with the Boston, Revere Beach & Lynn Railroad.

Under the terms of the bill the company is authorized to issue stock to an amount of not more than $100,000,000, with the right to increase its capital stock. The new company offers to electrify the Boston & Maine, Boston & Albany and the New Haven for a distance of 15 miles from the State House, operating for the benefit of the traveling public. The bill provides that the corporation shall file with the legislature, on or before Feb. 1, 1925, a report of the results of its negotiations accompanied by plans, terms, surveys, estimates and other data incidental to a comprehensive plan for consolidation of proposed lines.

Votes Down One-Man Car

City Council of Toledo Disapproves of Commissioner Cann's Plan for Changing Deficits Into Balances

One-man cars left the streets of Toledo, Ohio, at midnight on Thursday, Nov. 23, by vote of the City Council, which finally stood 16 to 3 against the new type of equipment.

Commissioner Wilfred E. Cann, who has made many changes in local operations to effect an operating deficit into balances each month for the stabilizing fund, in an effort to secure lower fares, recommended the one-man cars as one of the only remaining avenues to save money. The cars were placed in operation on the Bancroft line on July 1.

With these results Mr. Cann recommended to the Council committee the adoption of a weekly pass at $1 each as a trial with the idea of making the savings immediately available to the regular patrons in decreased fares. But the Council turned down the whole proposition largely on the recommendations of street car men and organized labor in general.

The ten one-man cars on the Bancroft line and twenty placed in operation a few weeks ago on the Cherry line were saving $3,750 a month, Mr. Cann told the Council. Approximately 50 per cent of the saving had been put back into increased service.

"By going back to the old type cars we lose the net savings and the public loses the net increase in service," declared the commissioner to the Council. "The surplus earnings for October which were credited to the stabilizing fund amounted to slightly less than $7,000. With the extremely high costs incident to operation of street railways today this surplus was effected by economies of such strict character that they cannot be continued."

Mr. Cann said that the total amount of money spent for maintenance of tracks, equipment and overhead per car-mile in Toledo was less now than the amount spent for maintenance of tracks alone in Detroit. An increase of 1 cent a car-mile for maintenance in October would have wiped out the entire surplus.

The commissioner argued that changes in equipment would do away with 75 per cent of the objections to the one-man car as it was placed in operation on the Cherry line—Peter Witt type with entrance and exit at front door—and that the weekly pass would eliminate the other 25 per cent of objections.

Savings effected by the one-man cars amounted to 22 per cent decrease in the labor costs of operation and at the same time a 6 per cent increase in service.

Readjustment Plan Operative

Final Steps Being Taken Under Which the Status of Affairs of New York Companies Will Be Changed

The so-called Interborough-Manhattan plan of readjustment, under which the intercorporate relations of the Interborough Rapid Transit Company and the Manhattan Railway, New York, will be placed on a new basis, has been declared operative by concurrent action of the three committees representing the security holders principally affected. The committee for Interborough-Metropolitan 4½ per cent bonds has accordingly called for payment on Dec. 27, the purchase price of the new ten-year 6 per cent Interborough notes, amounting to $160 on each $1,000 bond, or $32 a share of Interborough Rapid Transit Company stock.

Bondholders who exercise the option to take the notes will receive $160 in notes, 5.25 shares of Interborough Rapid Transit voting trust certificates, and five shares of Fifth Avenue Bus Corporation voting trust certificates. Bondholders who exercise the second option under the plan, that of not subscribing to the new notes, will receive 2.10 shares of Interborough Rapid Transit voting trust certificates and two shares of Fifth Avenue Bus stock certificates. Depositors of Interborough stock who elect to take the notes will get $32 a share in notes and one share of Interborough stock trust certificates.

Depositors of bonds with the committee who have not heretofore elected to subscribe to the notes may do so up to Dec. 27.

Execution of the readjustment plan, by relieving the Interborough Rapid Transit Company of a portion of the rental for the Manhattan Elevated lines and providing it with additional cash, is expected to work a practical reorganization of the company, putting it on its financial feet and ending threats of receivership. The holding company, Interborough-Consolidated Corporation, and all its stocks and bonds will cease to exist.

The capitalization of the combined Interborough Rapid Transit Company and Manhattan Railway will be as follows:

(1)	Interborough Rapid Transit Company 1st and refunding mortgage 5 per cent bonds........	$154,446,000
(2)	Interborough Rapid Transit Company 10 year 7 per cent notes secured by Interborough Rapid Transit Company bonds........	34,330,000
(3)	Manhattan Railway bonds.......	45,206,000
(4)	Manhattan Railway stock........	60,000,000
(5)	Interborough Rapid Transit Company unsecured 6 per cent notes.	10,500,000
(6)	Interborough Rapid Transit Company stock..................	35,000,000

All the other securities, including $45,700,000 principal amount of Interborough Consolidated Corporation preferred stock and 932,600 shares of no par value common stock of the same corporation, are wiped out. The $64,000,000 of 4½ per cent bonds of the Interborough Consolidated Company disappear and those who were formerly bondholders of that company now become stockholders of the Interborough Rapid Transit Company. The stock of the Interborough Rapid Transit Company was formerly pledged back of the Interborough-Consolidated bonds. The details of this plan were published in the *Electric Railway Journal* for Oct. 14, page 648.

As a step in the plan of readjustment the Fifth Avenue Bus Corporation was chartered in Delaware on Nov. 14 with a capital stock of $40,000,000. The details of this move were contained in a letter sent on Nov. 27 by the protective committee of the Interborough-Metropolitan 4½ per cent bonds to all bondholders.

The plan calls for a readjustment of the stock of the New York Transportation Company—a holding company owning the entire capital stock of the Fifth Avenue Coach Company, operating Fifth Avenue-Riverside Drive bus lines. The stock of the New York Transportation Company is now held by trustee in bankruptcy of the Interborough-Consolidated Corporation, which, under the Interborough-Metropolitan readjustment plan, will be liquidated.

According to the announcement the Interborough-Metropolitan Committee, Grayson M-P. Murphy, chairman, will acquire 103,574 shares of the New York Transportation stock now held by the bankrupt Interborough - Consolidated Corporation estate. This stock will be vested in the new bus company, which will issue enough no par value stock to provide five shares for each $1,000 of Interborough-Metropolitan 4½ per cent bonds, the stock so issued to be vested in voting trustees.

From time to time, it was stated, the new corporation probably will acquire additional stock of the New York Transportation Company, of which the general public now holds 131,476 shares, and that shares of the new concern shall be issued therefor. The Fifth Avenue Bus Corporation, it was explained, has offered to purchase the 103,574 shares of New York Transportation Company stock held by the Interborough-Consolidated Corporation at $3,262,581, or $31.50 a share, the market price as of Nov. 15.

The officers of the Fifth Avenue Bus Corporation are Grayson M-P. Murphy, president; Frederick Strauss, vice-president, and D. R. Noyes, treasurer. The directorate includes Charles H. Sabin, Charles S. Sargent Jr., Frederick T. Wood and Stephen Van Ness.

The Interborough Rapid Transit Company in September operated at a deficit of $464,759 after charges, compared with a deficit of $398,204 in September, 1921. Operating revenue increased $66,437 over revenue for September last year, while operating expenses and taxes increased $164,577, amounting to $2,977,649. A comparative statement of earnings for September, 1922 and 1921, follows:

	1922	1921
Gross..........................	$4,258,082	$4,191,645
Net after taxes..............	1,280,434	1,378,573
Total income................	1,331,008	1,425,409
*Deficit after charges........	466,759	398,204

* Exclusive of deficit accruals under the provisions of Contract No. 3 and related elevated certificates, which under these agreements with the city are payable from future earnings.

It is explained that the statement for September, 1922, is provisional pending final adoption of the Interborough-Manhattan plan, which provides for readjustment of fixed charges reducing Manhattan dividend rental, omitting temporarily sinking fund payment on Interborough first and refunding 5 per cent bonds and refunding existing 8 per cent obligations by issue of $34,330,000 of new 7 per cent ten-year notes. The deficit after charges for the three months ended Sept. 30, 1922, based on existing fixed charges, amounted $1,775,418.

In September both subway and elevated divisions of the Interborough system reported deficits after charges; the former shows a deficit of $46,962, compared with a surplus in September, 1921, of $10,195, the latter a deficit of $419,797, against a deficit last year of $408,398.

Holds One-Man Car Has Place

A systematic effort has been made by the Boston (Mass.) Elevated Railway to determine the precise place of the one-man car in the transportation system of Boston. It has held hearings in various sections to sound public opinion on the subject, trying to learn first hand what the patrons of the road think of the car. In conformity with the conclusions reached the company will recast its service and withdraw the one-man car from certain sections, and perhaps extend it to others.

The public trustees of the road held a meeting on Nov. 28 and passed the following vote on the subject:

> Voted: That the trustees of the Boston Elevated believe that the one-man car has a proper place upon the railway system which is under their management as the elevated, subway or tunnel train, the two-man car and the electric or motor omnibus each has its proper place, for the reason that rightly used the one-man car is a factor that makes possible more frequent service and extension of the 5-cent fare as well as economy in operation.
>
> Further voted, That the one-man car is not suited for operation under conditions of heavy traffic for the reason that under such conditions its use provokes and often seriously annoys passengers in boarding the car, and occasions delays which result in interruptions of schedule that interfere with efficient service; that therefore all changes necessary to bring the use of one-man cars under the rules above stated be promptly made.

No Prospects for Ending Strike

Efforts to end the strike of linemen and substation operators of the Cincinnati (Ohio) Traction Company have proved futile. H. H. Broach, International vice-president of the Brotherhood of Electrical Workers, who has been negotiating for the men, has left Cincinnati, apparently abandoning his efforts. The traction company has enough men at work to keep the lines in repair, according to Walter Draper, vice-president of the company. He said that the company was stringing no new lines at the present time, but that this work would be renewed Dec. 1 by men from another city.

The men went on a strike two weeks ago, when the traction company refused their request for a 25 per cent increase in salary.

Fifteen Injured in Interurban Accident

A Flint limited interurban car of the Detroit (Mich.) United Railway was hurled from its tracks when it hit an open switch at the Fair Grounds loop on Woodward Avenue, Detroit, on Friday evening, Nov. 17, and turned over, injuring fifteen of the seventy-five passengers aboard. The car covered a distance of about fifty feet after leaving the track, crossing the sidewalk and breaking a heavy pole supporting overhead telephone wiring before coming to a stop in the soft dirt in a vacant space beside the fair grounds.

Neither the motorman nor the conductor of the car was injured.

According to statements made shortly after the accident occurred, a city car using the same track had taken the electrically operated switch and entered the Fair Grounds loop shortly before the approach of the interurban. The switch remained open. It was reported that the switch would not close upon the approach of a car traveling faster than about twelve miles an hour. While the motorman stated that his car was going at the rate of about twenty or twenty-five miles an hour, some of the passengers were of the opinion that the speed was much greater.

When the trucks of the heavy car hit the loop the body of the car was hurled clear of the trucks. The fact that the accident did not prove more serious is attributed to the heavy construction of the car, which saved it from being smashed by the force with which it hit after leaving the open switch.

Patrolmen from a nearby booth notified the nearest station and fifteen patrolmen in the police flier arrived to take charge of the rescue work. A number of motorists also aided. The prompt work averted a panic.

After making their statements both members of the car crew were released.

Replies to One-Man Car Complaint

In reply to a letter by Paul A. Franke, secretary of the Twenty-Eighth Taxpayers' Protective Association, Brooklyn, N. Y., Lincoln C. Andrews, chief executive officer of the New York Transit Commission, upholds the uses of the one-man car. Mr. Franke calls the one-man cars "murder cars" and refers to an accident on Oct. 28 where a pedestrian was run over by one of these cars. In Mr. Andrews' reply it was made plain that the accident in question could not be attributed to carelessness on the part of the driver and that the records of the various companies throughout the country show that there are less street accidents from the use of one-man cars than there were when the same lines were operated by two-men cars. Further, that "the use of one-man car operation is being accepted and more and more broadly used throughout the country where traffic conditions and car equipment justify it."

In conclusion Mr. Andrews requests Mr. Franke to inspect the operation of a new type of one-man car equipment which has just been put into service on the Park Avenue line in Brooklyn.

Conferences on Wage Agreement

Officials of the Worcester Consolidated and the Springfield Street Railway Company are in conference with the officials of the Carmen's Union over the establishment of a wage agreement for 1923. They have held several conferences and have failed to reach an agreement.

Consequently the case will be submitted to a special board of arbitration. Bentley W. Warren will act for the companies and James H. Vahey for the unions, and if these men can come to an early agreement on a third arbitrator the case will come to a hearing within a week or two.

The men have asked for an increase in the maximum wages from 58 to 68 cents an hour, and the company has asked them to accept a reduction to 50 cents as the maximum. A reduction of 14 per cent is proposed for the trackmen and shop men.

News Notes

An Example of Spirit.—The Dallas (Tex.) Railway and its employees have contributed more than $2,000 for the support of Dallas charities during 1923.

Employees Perform.—The Colonial Minstrels, the members of which are Public Service Railway employees, recently conducted a successful two-night performance at Camden, N. J. William G. Scheina, assistant superintendent of the southern division of the railway, was the interlocutor.

Wage Agreement Continued.—The employees of the United Railways & Electric Company, Baltimore, Md., have accepted the offer of President C. D. Emmons to continue the present wage agreement. The contract which would have expired on Jan. 1, 1923, provides a scale of from 45 to 50 cents an hour for motormen and conductors.

Wages to Remain the Same.—Samuel W. McCall, neutral arbitrator in the Berkshire (Mass.) Street Railway's wage dispute, on Nov. 27, returned a report to the effect that wages shall remain the same for the year beginning June 1, 1922, as for the year preceding. Blue uniform men receive a maximum of 53 cents an hour. The 400 employees sought increases averaging about 25 per cent, while the company desired to reduce the pay by about 10 per cent.

Welfare Work Continues.—The director of the welfare department of the Interborough Rapid Transit Company, New York, N. Y., has submitted the annual report to the president and general manager for the year ended June 30, 1922. According to figures shown sixty-five men were listed on the pension payroll as of July 1, 1922. For the fiscal year ended June 30, 1922, the voluntary relief department paid out a total of $108,391, including sickness and accident benefits. The total amount of loans outstanding on June 30, 1922, amounted to $8,226.

Power Development Article Reprinted.—H. M. Atkinson, chairman of the board of directors of the Georgia Railway & Power Company, Atlanta, Ga., wrote an article in the Nov. 2 issue of the *Manufacturers' Record* entitled "Power Development of Georgia Railway & Power Company on Tallulah and Chattooga Rivers." The article has been reprinted in pamphlet form, with illustrations showing a remarkable series of aeroplane views of the properties and power development of the company in the counties of Habersham and Rabun, Georgia.

Protests Street Widening Plan.—An argument is on in Louisville, Ky., between merchants and the city administration over a proposed plan to widen two or three blocks of Fourth Avenue, the busiest street in the city, by cutting 15 ft. from the east side, with owners on the west side paying for the necessary changes. The change would result in resetting all car tracks, and perhaps result in less congestion in the widened area, but greater congestion where the street again narrowed. It would also cost the Louisville Railway a good deal of money in rebuilding its tracks.

Hydro Commission Favored.—By a vote of seven to five the City Council of Windsor, Ont., expressed its approval of the operation of the Windsor Municipal Railway by Ontario Hydro-Electric Commission. In other words the move of the transportation committee to call into conference delegates from other municipalities interested in the lines met with defeat. Alderman A. W. Jackson, who supported the recommendation of the committee, asserted that municipalities by their delegates should decide whether it was advisable to take advantage of the new municipal street act, and appoint a local commission to operate the railway system.

Seeks Twenty-five-Year Franchise.—The management of the Waterloo-Wellington Railway, an electric line operating between Kitchener and Bridgeport, has applied to the city for a twenty-five-year franchise. The present franchise ran out a year ago, and a year's extension was granted. This will be up in February. If the city will not grant the franchise the railway company was asked that the city of Kitchener purchase the line. The railway was offered to the city some years ago, and the City Council turned it down. The question has been turned over to the railway committee of the City Council, which will have a conference with the Light Commission.

Financial and Corporate

Valuation at $70,000,000

Brief Filed Fixes United Railways Valuation $20,000,000 Higher than Commission's Figure

Attorneys for the receiver of the United Railways of St. Louis have filed with the Missouri Public Service Commission at Jefferson City a brief declaring that the valuation of the company's property for rate-making purposes should be fixed at $70,000,000. This is $20,000,000 higher than the tentative valuation put on the property by the Public Service Commission in September, 1919.

The brief was filed by Charles W. Bates and T. E. Francis, attorneys for Rolla Wells, receiver of the United Railways, and for F. W. Doolittle and William H. Bennett, consulting engineers for the receiver.

It is stated by the brief:

> While under some theories of valuation announced by the courts and adopted by evaluating bodies as the yardstick by which to measure the present fair value of the property of a public utility for a rate base we should be justified in asking for a higher figure, we have concluded, after studying the evidence, that the above amount ($70,000,000) constituted the fair value of the property devoted to public use on Jan. 1, 1919.

After stating that additions to the property since Jan. 1, 1919, are matters for consideration by the technical staff of the commission, the brief says that the property involved included the United Railways and its subsidiaries, the Missouri Electric Railroad and the Florissant Construction, Real Estate and Investment Company, all referred to as "the company."

The brief outlined some statistical facts with respect to the United Railways. The company serves a population of about 1,000,000 and an area of approximately 240 square miles. It employs in the furnishing of transit service a total of 460 miles of track and overhead distribution system. It operates 1,449 passenger cars, 225 work service cars and three electric locomotives.

During the last calendar year for which complete figures are available (1921) the company, according to the brief, carried 282,447,190 revenue and 150,562,354 transfer passengers, a total of 433,009,544. In performing this service the receiver operated 44,301,764 car-miles and 4,789,450 car-hours, employing 3,508 trainmen and 2,118 other employees, including officers.

Purchase price paid to syndicates for shares of capital stock of underlying companies, measured by the market value of the securities of the United Railways given in payment	$32,811,105
Purchase of scattered stock of underlying companies	1,316,031
Bonds of underlying companies	13,980,100
New current assets of underlying companies assumed (a credit)	708,498
Purchase of suburban stock 1906	3,200,000
Suburban bonds assumed	7,500,000
Suburban current liabilities assumed	447,932
Construction 1890-1919	16,895,274
Working capital	2,253,876
Total	$76,895,820
To this is added $736,608 as the value of the Missouri Electric Company, making a grand total "historical cash investment" of	$77,632,428

The brief includes a table to show what is termed "the historical cash investment" of the United Railways and the Missouri Electric Company as of Jan. 1, 1919. The table for the United Railways is given herewith.

By "historical cash investment" is meant the aggregate purchase price paid by the United Railways for the property, together with the amount of working capital employed in operating the properties and the cost of constructing all extensions, additions and permanent improvements.

Recently Sold Property to Be Improved

The property of the Maumee Valley Railways & Light Company, sold at sheriff's sale to Marion Miller, president of the Home Savings Bank, Toledo, and chairman of the bondholders' protective committee, on Nov. 15, will be turned over to the Maumee Valley Railway. A reorganization and extensive improvements will be made with $100,000 of new capital.

The property sold for $50,000. It has been operating at a loss for the last three years.

Following recommendations of engineers who made a recent survey of the property one-man safety cars of the light interurban type will be put into service rather than gasoline-driven cars. Both had been under consideration. Seven of the new cars will be purchased. Heretofore the company has rented most of its equipment from the Community Traction Company.

The new company will seek twenty-year franchises in Maumee and Perrysburg, the twin villages up the river from Toledo. In return the railroad will promise twelve-minute headway service, the new equipment, and possibly reduction in fares. The general plan is more or less contingent upon the granting of the franchises.

The Maumee Valley Railway will have an authorized bond issue of $500,000, of which only $350,000 will be outstanding. There are $300,000 of 5 per cent underlying bonds of the old company represented by the bondholders' protective committee.

In addition the new company will issue $100,000 of preferred stock and $400,000 worth of common stock.

LeRoy Eastman, of the law firm of Smith, Baker, Effler, Allen & Eastman, is attorney for the bondholders' committee.

Electric Line Sold—Improvements and Extensions Contemplated

John B. Weekley of Birmingham has purchased the electric railway system of the Alabama Traction Company, which operates electric cars in Decatur and Albany, Ala. The consideration was not made public.

The Alabama Traction Company has been in the hands of a receiver for some time, hence the purchase of the electric property by Mr. Weekley depends upon the confirmation of the sale by the United States Court. A representative of Mr. Weekley said that the matter of confirmation of sale would come before the United States Court on Dec. 15, and that he was confident the sale would be confirmed at that time.

Mr. Weekley's representative stated that it was the intention of Mr. Weekley to organize a stock company, which would take over eventually the electric lines of Decatur and Albany. It is stated from Decatur that Mr. Weekley is contemplating improving and extending the lines, just as soon as the confirmation of the sale by the United States Court is completed and all necessary details are arranged.

Mr. Weekley was before the Decatur City Council recently and asked for a thirty-year franchise over the streets of that city for the operation of the electric lines. This franchise has been granted. A similar franchise was asked for at the hands of the Albany City Council. The Albany franchise is now in the hands of a committee, and reports from Albany say the franchise will be granted. The present franchise of the Alabama Traction Company has but a short time to run, it is stated.

The stock of the Alabama Traction Company is owned largely by Eastern interests, which have controlled the company for a number of years. The Alabama Traction Company is the oldest street car company in North Alabama. The company had its beginning in 1887 when Sam Wharton built about 2 miles of track and operated mule cars over these tracks. About the year 1906 Mr. Wharton sold out to a stock company, which converted the proposition into an electric street car system, connecting the cities of Decatur and Albany. The company went into bankruptcy about five years ago and since that time has been operated by a receiver.

Today the Alabama Traction Company's trackage is about 10 miles, the lines reaching the principal sections of Decatur and Albany. They have a number of modern street cars and a large brick carhouse and offices.

It is understood from Decatur that people in several of the outlying suburban sections of Decatur and Albany are asking for street car lines to be built to those sections. It is believed that Mr. Weekley and his company, when fully organized and ready for business, will extend the lines for several miles, reaching out to the principal suburbs of Decatur and Albany.

Improvement Seen in Brooklyn Report

An improved condition is noted in the four months' operation of the Brooklyn (N. Y.) Rapid Transit Company ended Oct. 31, 1922. Compared with a net income of $724,097 for the four months ended Oct. 31, 1921, the net for the same period this year stood at $1,032,114. Total operating revenues were $12,140,178 against $11,501,296 a year ago. Expenses this year were $7,982,153 against $7,618,286 for the same four months in 1921. The improvement was credited to strict economy.

Reorganization Plan Up for Approval

Approval of the reorganization of the Syracuse & Suburban Railroad, Syracuse, N. Y., as the Syracuse & Eastern Railroad has been asked of the Public Service Commission. Edward Powell, representing the bondholders who bought the road under foreclosure sale, made the application. The new concern asks authorization to issue $300,000 in common stock and $512,000 in bonds, which are to be delivered to the reorganization committee for payment of the railroad property.

The new company will not take over a spur line tapping Montclair and did not include it in its petition to the commission. The abandonment of the spur line has brought a wide protest.

October Operations in Toledo Show Surplus

October operations of the Community Traction Company, Toledo, Ohio, show that a surplus of $6,991 was added to the stabilizing fund, which now shows a balance of $174,313, according to the report made by Commissioner W. E. Cann to the Board of Control at its mid-month meeting.

The city ownership or sinking fund now amounts to $362,316, of which $255,000 is represented by 6 per cent bonds of the company which have been purchased.

During October the gross earnings amounted to $311,117, representing an increase of $6,746 over the same month last year.

Operating expenses also showed an increase of $10,620, due in large part to credit for overpayment on power returned last year. Increased maintenance and higher taxes produced a net income of $49,925, being approximately $10,000 less than for the month of October last year.

During the month there were operated 651,096 car-miles, as compared with 625,758 for October, 1921. Revenue passengers totaled 5,032,026, an increase of 285,326 over the same month last year. The increase in riding is due principally to elimination of direct bus competition and the improvement in industry.

Commissioner Cann gave the Board of Control a complete history of his dealings with the Council on the one-man car subject and outlined his belief that changes in equipment and trial of the weekly pass at $1 would show remarkable results in favor of the new one-man cars.

He said increased charges for maintenance would be necessary soon.

1921 Income Amounts to $230,531

The board of directors of the Washington, Baltimore & Annapolis Electric Railroad, Baltimore, Md., recently submitted to the shareholders a report on the operations for the year ended Dec. 31, 1921. Railway operating revenues for 1921 were $2,512,540, against $2,092,334 for 1920. Operating expenses advanced from $1,534,206 in 1920 to $1,810,455 for the year ended Dec. 31, 1921. The net income in 1921 was $230,531.

This figure is considered low when compared with former years. In 1917 the net income was $462,651; 1918, $494,536; 1919, $319,400; 1920, $287,006. The 1921 figures include operation of the Annapolis Short Line.

Surplus of More Than $1,010,347 for Nine Months

For the first nine months of 1922 the Virginia Railway & Power Company, Richmond, Va., realized a surplus of $1,010,347 after deducting all items except depreciation and reserve. The gross earnings for the nine months' period in 1922 were $6,830,822, which represented a decrease of $778,233 over the same period in 1921. However, there was a decrease in expenses in 1922 amounting to $1,099,705. This decrease helped materially the net earnings of $2,583,487, an increase of $321,473 over the first nine months' net earnings of 1921. The company's statement shows a much improved financial condition.

Sioux City Railway and Light Properties Merge

The Sioux City Service Company and the Sioux City Gas & Electric Company recently came under the same control when a merger was completed on Nov. 2. This settlement places both companies under the control of the United Gas & Improvement Company, which has had an interest in the gas and light company at Sioux City for some time. The merger was in accordance with an ordinance passed by the City Council and approved by the people of Sioux City on Aug. 28. The property of the Service Company, which operates the railways in Sioux City and furnishes part of the power and lighting service, is valued at approximately $4,000,000.

H. L. Kirk, formerly general manager of the Service Company, has been elected president to replace R. J. Dunham, who has resigned. W. J. Bertke, formerly general superintendent of the Gas & Electric Company, has been elected vice-president and general manager of the Service Company. Mr. Bertke will hereafter be in charge of the operation of the street railway system in addition to the gas and electric properties.

The merger will mean little or no change in the railway service; however, ambitious plans have been laid for enlarging the gas and electric service through the installation of additional mains and transmission lines. The merger has also made possible the consolidation of the two power and lighting services so that they can now be operated as a unit.

Improvement in 1922 Operation Noted

The annual report of the United Light & Railways Company, Grand Rapids, Mich., for the calendar year 1921 contains a comparative statement of operation for the twelve months ended Sept. 30, 1922, compared with the twelve months ended Dec. 31, 1921. This statement shows the progress the company made during the first nine months of 1922. The gross earnings for the year ended Sept. 30, 1922, were $11,467,995, an increase of $93,179 over the calendar year ended Dec. 31, 1921. The operating expenses decreased from $8,002,742 to $7,886,079 for the twelve months ended Sept. 30, 1922. The balance after all dividend charges for the 1922 period was $982,899 against $833,201 for the year ended Dec. 31, 1921.

Financial News Notes

Authorizes Purchase.—The City Council of Toronto, Ont., has passed a by-law authorizing the purchase of the Toronto Suburban Railway, including the line to Guelph.

Authorizes Bond Issue.—The Missouri Public Service Commission has given authority to the Hannibal Railway & Electric Company, Hannibal, Mo., to issue $150,000 first mortgage 7 per cent bonds, due Nov. 1, 1932.

Bonds Offered.—Halsey, Stuart & Company, Philadelphia, Pa., are offering $3,500,000 of the Sioux City Gas & Electric Company's first mortgage 6 per cent gold bonds, series "A." The bonds, in denominations of $1,000, $500 and $100, are offered at 99½ and interest yielding about 6.05 per cent. The due date is Sept. 1, 1947.

Balance Shows Increase.—For the twelve months ended Oct. 31, 1922, the Republic Railway & Light Company, Youngstown, Ohio, reports gross earnings of $7,793,409, against $7,568,619 for the twelve months ended Oct. 31, 1921. Operating expenses and taxes in the 1922 period decreased $110,639. The balance for depreciation, dividends and surplus was $551,843 in 1922, an increase of $269,079 over the twelve-month period ended Oct. 31, 1921.

Traffic and Transportation

Council Rejects Proposal

Seattle Body Tables Mayor's Request for Lower Fare—Other Developments in Discussion

After extended discussion and debate by Mayor E. J. Brown and members of the City Council of Seattle on the advisability of bringing up for decision at this time the matter of a 5-cent fare on the lines of the Seattle (Wash.) Municipal Railway, the City Council, as a whole, voted to table the Mayor's most recent proposal submitted to the Council in letter form. The Mayor's letter recommended the adoption of a 5-cent carfare, effective Feb. 1, with the issuance of transfers only for tokens to be sold at the rate of four for 25 cents or 6¼ cents each. Mayor Brown had first intended that the matter as to whether the deficit caused by a 5-cent fare should be made up by taxation be submitted to the voters at the spring election, but decided later that this move would be inadvisable.

The City Council, after discussion of the Mayor's recommendation, tabled the letter, on the ground that it would be most impolitic to talk about reductions in carfare before the United States Circuit Court of Appeals renders a decision in the street car litigation now before it. Decision in the so-called "specific performance suit" brought by the Stone & Webster interests against the city in the street car litigation is expected daily. The case was heard two months ago by three judges of the Circuit Court of Appeals, sitting in Seattle, arguments being presented by the legal representatives of the Puget Sound Power & Light Company and the city of Seattle on Sept. 19.

In this case the power company asked for a decree directing that in event the revenues of the street railway are sufficient to pay the interest and principal on the $15,000,000 bonds given for the railway system, but not sufficient to pay all cost of maintenance and operation, the city should make up the deficit in cost of operation and maintenance out of the general tax fund or any other available fund.

Judge E. E. Cushman last spring before the State Supreme Court, in the "fourteen taxpayers" suit, made a decision that under no circumstances could the city's general fund be invaded for the support of the Municipal Railway. Following the State Supreme Court's decision, the city appealed the decision of Federal Judge Cushman in the specific performance suit to the United States Circuit Court of Appeals, asking that the decree entered by Judge Cushman be annulled and set aside. The Circuit Court of Appeals decision is the one expected daily.

There were other developments in the carfare discussion. Superintendent D. W. Henderson said that the railway could return to a 6¼-cent fare, that is, four tokens for 25 cents, by March 1, probably without any deficit. The Mayor rejected, on advice of Councilman Erickson and Superintendent Henderson, the idea of the weekly pass system. A discussion was held on the plan of adopting the pay-as-you-leave system of fare collection for outbound cars and pay-as-you-enter system for inbound cars.

MAYOR'S LETTER QUOTED

In his letter to the City Council, Mayor Brown said:

> The obligations of our transportation system were made under the present carfare charge, and all obligations due and payable will be met Feb. 1, 1923, and I see no reason why a reduction in carfare cannot be made to take effect on that date. Many plans have been suggested and I have given careful consideration to each and every one of them, carefully considering at all times that our transportation system should be popularized and brought into public favor by lowering the rate of charges on car-riding to the public and increasing the gross revenue.
>
> The pass system has been investigated. But the pass system would not give relief in lower carfare to the citizens of Seattle who are compelled to use the street cars, but would only afford cheaper transportation to those who are constantly moving about the city. It would give that class transportation far below cost.
>
> The people of our city are accustomed to using a transfer. If we were to abandon the transfer and sell car ride tokens at 4 cents, no one would pay 5 cents for a ride, when they could buy tokens for 4 cents. This would endanger the revenue and would compel transfer users to pay two fares, and would not be equitable.
>
> I believe that a 5-cent carfare for all straight rides will secure for our transportation system all the short rides that 4-cent tokens would do. I believe that our citizens are willing to pay 6¼ cents, or 25 cents for four tokens, in all cases where transfers are to be used.
>
> I do not believe that our homeowners should at any time be asked to make up any deficit that may arise from the operation of our transportation system.

Permits Elimination of Low Ticket Rate

The City Council of Meridian, Miss., recently granted the privilege to the Meridian Light & Railway Company of eliminating the present rate of 5 and 6¼ cents for tickets. This ticket rate will be replaced by a 7-cent ticket charge, to be sold in strips of five for 35 cents, and will have a universal transfer privilege. The present 10-cent cash fare and school ticket rate of 3⅓ cents will remain in force.

H. G. Bonner, general manager of the Meridian Light & Railway Company, sent a letter to the City Council requesting such changes because of the company's insufficient income. He said that the experiment with the 5-cent fare had proved a failure after a trial period of nine months. He claimed further that the results showed that the 5-cent ticket fare had increased riding to a very limited extent, so that the net result had been to decrease railway income about $113 a day as compared with the income for the same nine months of last year. In spite of materially reduced expenses the railway was now failing to make its operating and maintenance expenses by over $100 a day.

Fight on Jitneys Renewed

Company at Albany, N. Y., Determined Unfair Competition Growing Out of Strike Shall Stop

An aftermath of the United Traction Company's trolley strike in Albany and Troy a year ago is the continued operation of jitneys between Albany and Troy and Troy and Averill Park. Recently Justice Ellis J. Staley in the Supreme Court imposed a fine of $250 or thirty days in the Albany county jail on six operators of jitneys who have been operating in the face of an injunction granted during the strike by Justice Harold J. Hinman. Only two of the six adjudged guilty were present in the court at the time they were declared in contempt.

J. Stanley Carter, representing the United Traction Company, made proof of the service of charges of violations on sixteen men. Those not adjudged guilty were represented by attorneys, who asked for adjournments to make a defense. They were given until Nov. 29 to present affidavits disproving the charges, and at this time if Justice Staley is in doubt as to their guilt on the affidavits he will require the production of the witnesses on both sides at a hearing on Dec. 2 in special term.

OPPOSED TO ADJOURNMENT

Mr. Carter opposed any adjournment of the proceedings and said the injunction order was well known to the defendants operating jitneys illegally and that all the judges of the district have imposed fines on those who have been adjudged guilty for more than a year. He said they have been making a joke of the order of the court and persist in violating the law and the injunction.

The United Traction Company included many other alleged jitney operators in the show cause order, but they have not been served. Efforts will be made, Mr. Carter said, to bring these additional defendants into court to put an end to jitneying.

Warrants for the arrest and commitment of the six men adjudged guilty of contempt of court were placed in the hands of Sheriff John J. Allen, of Albany County, who will either collect the fines or take them to jail to serve their sentences.

The operation of jitneys between Albany and Troy, due to the fact that the boat line did not run ferries during the past summer on account of the coal situation, has been a particularly lucrative venture and the jitney operators have been willing to take the chance. While the fare on the jitneys is higher than that of the traction company many persons have preferred that means of transportation because of its celerity. The traction company is now determined to stamp out the last remaining signs of competition in this line.

Law Does Not Require Cut in Capital Traction Fare

In reply to an application of the Federation of Citizens' Associations seeking a reduction in fare on the lines of the Capital Traction Company, Washington, D. C., Corporation Counsel Stephens recently advised the Public Utilities Commission that the law did not require a cut in the fare on the Capital Traction cars on the ground that that company was earning more money than the Washington Railway & Electric Company. It was the position of the federation that the commission was acting without authority in maintaining the same fare for both companies when the rate gave the Capital Traction a larger return. It is believed that the commission will reject the application.

Arguing that the commission had no power under the law to fix a rate of return upon valuation which is greater for one company than for another, Mr. Stephens went on to say that the decisions of public utility commissions and courts throughout the country had established the principle that a public utility corporation had the right to earn a fair return upon the investment, which would have to be decided by the Public Utilities Commission having supervision of the subject. "Certainly," he said, "it cannot be conclusively said, as argued on behalf of the citizens' associations, that it is discrimination, within the meaning of the law, to allow one rate of return for one company and a larger rate for another, because the law is entirely silent upon this subject.

Concluding Mr. Stephens said in part:

> I do not think the argument could be maintained before any judicial tribunal that the commission is guilty of a discrimination, in the legal sense, in fixing the same rate of fare for both street railroad systems of the District of Columbia, especially so in view of the fact that it is generally recognized by those cognizant with the subject that to do so would seriously cripple, if not permanently wreck, one of the great transportation systems in the city.

Pass Plan Extended—Mayor Prefers Five-Cent Fare

The Tacoma Railway & Power Company has received notice of an extension of the pass system for ninety days, the initial trial period of the system expiring Nov. 26. During the trial period the company has built up its pass patronage from 7,000 to 11,000 a week, and company officials, including Manager Richard T. Sullivan, consider the system a success. The renewal of the trial period will run to Feb. 25, 1923, at which time the company hopes the system will have proved itself a success to the point of warranting its permanent adoption. Figures given out by the company show that the system has increased traffic during the non-peak hours to an average of 4½ cents per ride.

Mayor A. V. Fawcett, who has made a vigorous fight for a 5-cent fare for Tacoma residents and who started a bus system on routes where travel was heaviest in an effort to compel the traction company to grant a 5-cent fare, states that he would like to see the pass system made permanent, but that he also wanted a straight 5-cent fare for the workingman. Discussing the question, Mayor Fawcett said that the present system economically was beneficial to about half the residents of Tacoma as compared with previous cost conditions. He believed that the pass encouraged people to go down town more often and afforded more opportunity for spending money. He said he did not object to the pass plan, but believed the solution of the fare problem lay in the 5-cent rate.

Refuses Ordinance for Bus Operation

The City Council of Richmond, Ind., at a recent meeting, refused to consider an ordinance on third reading which would have granted a franchise to a company to operate passenger buses in the streets of that city. The ordinance was postponed indefinitely. The proposed bus line was to operate in competition with the car lines of the Terre Haute, Indianapolis & Eastern Traction Company. The Council was disposed to favor the bus lines when the ordinance was first introduced some weeks ago, but since that time there has been some criticism of the ordinance. The traction company has indicated its intention of improving city service where a survey indicates improvement is needed. New cars are to be put on some lines.

Pasadena Has "Weekly Pass"

Effective Nov. 27, the Pacific Electric Railway will establish a "weekly pass" plan on its local lines in Pasadena, Calif. This will provide passengers with a pass good for an unlimited number of local trips at a cost of $1 weekly. The pass is transferable; the only limitation is that the pass is honored for only one person on any one trip of a car.

The passes will be sold at local ticket offices of the company and on local cars beginning on Monday of each week and will be good for passage until midnight the following Sunday. They will be accepted on interurban trains for transportation within local zone fare limits. The company introduced the weekly pass plan for the first time on its local lines in September, 1922, in Riverside and Pomona, and Pasadena, the third point, is decided upon in a continuation of the plan to test the acceptability of the weekly pass to the patrons.

Another City Will Try "Pass"—It was recently announced by an official of the Interstate Public Service Company that the weekly pass plan would be adopted on the lines in New Albany, Ind. It will be the regular $1 transferable pass good for one week, although only one person may ride on it at a time. The date for starting the new plan has not been announced, but it is probable that it will be Dec. 3.

Rejects Application

Commission Disapproves Extension of Washington Bus Company's Lines—Railway Service Adequate

The Public Utilities Commission of the District of Columbia has declined to approve the application of the Washington Rapid Transit Company for an extension of its service. In refusing the petition the commission stated that earlier approval for the establishment of bus lines on a number of routes now being served had been given because at that time the street car lines were seemingly unable during the rush hours to provide adequate and convenient carrying capacity for the public. The number of car riders were then greater than at present, however, and the conditions that warranted the comparatively large invasions of the regions already served by the railway no longer present themselves.

If the Public Utilities Commission were now to grant further bus extensions of like character, while promoting the convenience of relatively few, they would tend to damage the interests of greater numbers of the people. The commission spoke further of the high investment required by the railway company in installing the underground type of construction and the fact that they are required to pay a tax of 4 per cent on their gross receipts, pave a large portion of the streets and pay the salaries of the street crossing policemen, all of which must be earned over and above the so-called fair return out of the receipts of the car riders.

The Public Utilities Commission said that certain diagonal streets not occupied by car lines lend themselves to a more direct and more rapid transportation than can be had on the railway lines and that bus lines had been permitted for that reason. Such bus lines, however, have invariably taken from the car companies the cream of their traffic—the short-haul rider—and this notwithstanding the fact that bus lines pay into the public treasury no portion of their gross receipts, no paving tax and nothing for street crossing policemen.

In opinion of the commission there is a legitimate field for bus service, but this does not lie in the multiplication of lines or vehicles reaching the heart of the city. It lies rather in providing service in extension of the street car lines into territory so thinly settled as not to justify the large investment necessary for street railway service.

The bus lines should be feeders. They should create business and not rob the street railways of the just reward due to their heavy investment for the public benefit. The commission also stated that such public service as was justified in a city should be owned and operated by the street railway companies and co-ordinated so that transfer privileges and other desirable joint relations would result.

Personal Mention

J. R. Ong Consultant

Mr. Ong Has Resigned from Atlanta Company to Take Up Independent Work

Another proof of scientific specialization in the field of mass transport is the creation of the job of transportation engineer, the man who co-ordinates the efforts of the mechanical department in providing the transportation equipment and of the operating department in handling that equipment to best advantage. It involves the analysis of operating methods to the end that good service may be rendered economically. One of the earliest workers in this field has been J. R. Ong, who after varied experience on both large and small properties and in both the operating and regulating fields has just hung out his shingle as consulting transportation engineer. He will make his headquarters at Piqua, Ohio, because of its central location.

J. R. ONG

Mr. Ong in taking up independent work resigns as transportation engineer of the Georgia Railway & Power Company, Atlanta, Ga. While connected with the Atlanta property he has done much to co-ordinate schedules with traffic and has been instrumental in planning methods to improve "on-time" operation; but even more to study the general trend of the city's growth so that proper provision would be made in the future for maintaining and bettering the company's standards of service. In this he has had the encouragement of F. L. Butler, general operating manager, who induced Mr. Ong to come to Atlanta after previous association with him in his work with the Winnipeg (Canada) Electric Railway.

A review of the positions which Mr. Ong has held indicates that he is well equipped for his new work. In 1909 he was graduated from Purdue University in electrical engineering, having previously been with the Indianapolis & Cincinnati Traction Company and the Chicago, Lake Shore & South Bend Railway in the car shops during the stressful period of construction and inaugural operation. From Purdue Mr. Ong became an apprentice with the Westinghouse Electric & Manufacturing Company at its main plant in East Pittsburgh and was later transferred to the company's Philadelphia sales office. In 1911 he became superintendent of substations on the Fort Dodge, Des Moines & Southern Railroad, Boone, Iowa.

With the experience obtained in the manufacturing, commercial, construction and operating side of electric transportation, Mr. Ong has completed the circle by work with the regulating bodies. From 1912 to 1918 he was a member of the joint engineering staff serving the Railroad Commission of Wisconsin and the Wisconsin Tax Commission. In this position he not only made investigations of street and interurban railway service matters but was also engaged in the valuation of these properties. Later he resigned to become traffic engineer for the board of control of the Kansas City Railways, following which he went to Winnipeg, where he made a fine record for economical operation, at the same time maintaining a high standard of service.

Municipal Railway Advocate Will Go to Washington

James Couzens, Mayor of Detroit, has been appointed by Gov. Alexander J. Groesbeck as United States Senator from Michigan. He will fill the unexpired term of former Senator T. H. Newberry, resigned. The appointment has been accepted.

Mayor Couzens has long been a prominent figure in Detroit. In 1919 his proposition to purchase the Detroit United Railway lines was defeated. Undaunted, he obtained permission from the voters to build a municipal system. Later, he arranged for the purchase of the privately-owned system and, after the voters had approved, consolidated it with the new municipal lines. This undertaking by the city of Detroit became effective last May. Complete details of the taking over of the lines were given in the *Electric Railway Journal*, issue of May 20, 1922.

New Director in Electrical Engineering School

Paul M. Lincoln has recently been appointed director of the school of electrical engineering in the College of Engineering, Cornell University. He succeeds in this position the late Alexander Gray. Mr. Lincoln brings to his new position a practical engineering experience of nearly thirty years with wide connections in the engineering world. He has been connected with the Short Electric Company, Cleveland; the Westinghouse Electric & Manufacturing Company, Niagara Falls Power Company and the Lincoln Electric Company, which had been organized by his older brother in 1894. For many years he has taken an active interest in the affairs of the American Institute of Electrical Engineers. In 1902 he invented the synchroscope, a device which has come into universal use where alternating-current machines are paralleled. For this invention he was awarded the John Scott Medal by the city of Philadelphia on recommendation of the Franklin Institute of that city.

Edited from the Cars

"Boise Valley Stotts" Has Traveled 121,680 Miles by Interurban Railroad in Quest of News

Editing a department of a well-established daily newspaper literally from an electric railroad is unique even in these modern days, but it has been done for almost seven years by James R. Stotts, editor of the Loop Department of the Boise *Evening Capital News*, better known throughout Idaho, Oregon and Washington as "Boise Valley Stotts" because of the big part he has played the past thirteen years in the development of the Boise Valley and its agricultural, horticultural, dairying and livestock raising industries.

J. R. STOTTS

His faith in the Boise Valley since he came to it in the early part of 1910 has been of an optimistic nature and his vision of the greatness of its future has been clear, for before the Gem Irrigation district tributary to the Boise Valley was reclaimed he traveled over the great desert then comprising it and predicted its ultimate reclamation. It was on April 1, 1916, that Mr. Stotts initiated the "Interurban Department" of the evening paper of Boise, using the interurban electric railroad of the Boise Valley Traction Company in making his daily 60-mile trip around the valley, and from the date of the initiation of his department up to the present he has never had a vacation and has missed only one day from his work, that day's absence having been due to sickness. Up to Oct. 1 of the present year Mr. Stotts had worked 2,027 days, used 121,680 miles of interurban railroad mileage and written for his department approximately 10,000 columns of news matter.

The psychology and value of "Touching Elbows with Folks" and especially those engaged in agriculture is thoroughly understood by him and it is probable that he knows and can call by name not less than 20,000 people of the different communities of the valley. He knows their environments, has studied their industries and is constantly active in every movement for the progress of those industries. One of his penchants is getting the view of the other fellow and understanding his problems. If Bill Smith and his neighbors import a pure-bred bull into the community they tell "Boise Valley Stotts" and he writes of it. If one of them has raised the standard of his hogs "Boise Valley Stotts" is advised and the incident is given publicity, or if a bumper crop has been produced he is told of it. He has a mania for statistics and he can tell you the exact annual revenue of any of the valley's industries or the exact annual shipment of any commodity and its total value.

Both of the local newspapers of Boise carry an "Interurban Loop Department" and this results in considerable free and valuable advertising for the traction company.

Guy A. Richardson Resigns

Guy A. Richardson, vice-president in charge of operation of the Philadelphia (Pa.) Rapid Transit Company, has announced his resignation. The reason for his leaving the Mitten forces was not disclosed. It was said that Mr. Richardson had originally intended to resign on Oct. 13, but had remained to assist in the scheduling of the Frankford Elevated Market Street subway routes.

In April, 1919, Mr. Richardson came to Philadelphia as superintendent of transportation, leaving the position of general superintendent of the Puget Sound Traction, Light & Power Company. Within a year he was elected vice-president of the company, becoming one of the youngest electric railway executives in the country. On one occasion Mr. Mitten pronounced Mr. Richardson "the best transportation operating engineer in America."

R. F. Tyson, assistant to Mr. Richardson, will temporarily assume the duties of vice-president.

A. E. Duty Dead

A. E. Duty, assistant general manager of the Cleveland (Ohio) Railway, died on Nov. 29. Mr. Duty had been with the electric transportation system in Cleveland for more than fifty years. He served from 1912 until eight months ago as general superintendent of transportation, at which time he was promoted, on the death of George L. Radcliffe, to the position of assistant general manager.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE
MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Commercial Community Co-operates

An extract from the forthcoming annual report of the Secretary of Commerce for the fiscal year 1921-1922 refers to the administrative work of the department in the matter of revising commercial statistics. It said that through the manufacturers' associations, committees were created in the principal industries, and upon their advice the work of the Bureau of the Census in this important direction had been reorganized and simplified. Further, that co-operation had also been established with various trade associations for the proper publication of current statistics bearing on production and distribution, and the monthly publication entitled "Survey of Current Business" had been started by the department and had been greatly welcomed by the business community.

Co-operation on Specifications for Federal Purchases

The American Engineering Standards Committee has appointed a standing committee on co-operation with the Federal Specifications Board with the object in view of eliminating the differences between specifications for government purchases and the usual practice of commercial supplies. Many manufacturers of electric railway supplies furnish the government with materials, so that this co-operation promoted through this committee "will give the industry a better opportunity to participate in the development of specifications for government purchases and it will at the same time bring to the government, to a greater degree than has heretofore been possible, the talent of the 200 industrial organizations co-operating in the work of the American Engineering Standards Committee." It is expected that the net result will be national specifications recognized by the industry and government alike.

Advice Offered on Export Problems

The National Foreign Trade Council New York, N. Y., has announced the organization of a Trade Adviser Service "to act throughout the year as a medium for the interchange of experience on foreign trade problems." According to the anouncement more than 100 leading foreign trade executives from all parts of the United States have agreed to co-operate in this work.

This service will be given without obligation to the inquirer and without remuneration to the adviser "solely with the bigger and broader point in view of assisting in the development of American foreign trade."

The general chairman of the Trade

ELECTRIC RAILWAY MATERIAL PRICES—NOV. 28, 1922

Metals—New York

Copper, electrolytic, cents per lb	13.625
Lead, cents per lb	7.10
Nickel, cents per lb	39.00
Zinc, cents per lb	6.975
Tin, Straits, cents per lb	36.50
Aluminum, 98 to 99 per cent, cents per lb	22.50
Babbitt metal, warehouse, cents per lb.:	
Fair grade	35.00
Commercial	25.00

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$8.00
Somerset mine run, Boston	4.00
Pittsburgh mine run, Pittsburgh	2.625
Franklin, Ill., screenings, Chicago	2.50
Central, Ill., screenings, Chicago	1.675
Kansas Screenings, Kansas City	2.50

Track Materials—Pittsburgh

Standard Bessemer steel rails, gross ton	$40.00
Standard open hearth rails, gross ton	40.00
Railroad spikes, drive, Pittsburgh base, cents per lb	2.75
Tie plates (flat type), cents per lb	2.35
Angle bars, cents per lb	2.75
Rail bolts and nuts, Pittsburgh base, cents, lb.	4.17
Steel bars, cents per lb	2.00
Ties, white oak, Chicago, 6i n. x 8 in. x 8½ ft.	1.40

Hardware—Pittsburgh

Wire nails, base per keg	2.75
Sheet iron, (28 gage), cents per lb	3.00
Sheet iron, galvanised, (28 gage), cents per lb	4.00
Galvanized barbed wire, cents per lb	3.40
Galvanized wire, ordinary, cents per lb	2.50

Waste—New York

Waste, wool, cents per lb	15.00
Waste, cotton, (100 lb. bale), cents per lb.:	
White	14.00
Colored	12.00

Paints, Putty and Glass—New York

Linseed oil, (5 bbl. lots), cents per gal	90.00
White lead, (100 lb. keg), cents per lb	12.125
Turpentine, (bbl. lots), per gal	$1.55
Car window glass, (single strength), first three brackets, A quality, discount*	84.0%
Car window glass, (single strength), first three brackets, B quality, discount*	86.0%
Car window glass, (double strength, all sizes, A quality), discount*	85.0%
Putty, 5 lb. tins, cents per lb	5.50

*These prices are f.o.b. works, boxing charges extra.

Wire—New York

Copper wire base, cents per lb	15.75
Rubber-covered wire, No. 14, per 1,000 ft	6.70
Weatherproof wire base, cents per lb	16.00

Paving Materials

Paving stone, granite, 4 x 8 x 4, f.o.b. Chicago, dressed, per sq.yd	$3.35
Common, per sq.yd	3.10
Wood block paving 3½, 16 treatment, N. Y., per sq.yd	2.39
Paving brick, 3½ x 8½ x 4, N. Y. per 1,000 in carload lots	50.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd	1.75
Cement, Chicago consumers net prices, without bags	2.60
Gravel, ¾-in., cu.yd., N. Y	2.00
Sand, cu.yd., N. Y	1.00

Old Metals—New York

Heavy copper, cents per lb	12.00
Light copper, cents per lb	9.50
Heavy brass, cents per lb	6.50
Zinc, old scrap, cents per lb	4.50
Yellow brass, cents per lb (heavy)	7.00
Lead, heavy, cents per lb	5.75
Steel car axles, Chicago, net ton	$18.00
Old car wheels, Chicago, gross ton	16.50
Rails (short), Chicago, gross ton	18.75
Rails (relaying), Chicago, gross ton	33.50
Machine turnings, Chicago, net ton	9.75

Adviser Service is E. P. Thomas, president United States Steel Products Company; A. E. Ashburner, American Multigraph Sales Company is vice-chairman, and C. J. Warren, Remington Typewriter Company, is executive chairman.

Automatic Substations for Baltimore

The United Railways & Electric Company is contemplating the installation of automatic substation equipment in its substations during 1923. A study of the advantages of such installation is now being made under the direction of Vice-President H. B. Flowers.

Rolling Stock

Maumee Valley Railway, Toledo, Ohio, the new company formed by the acquisition of the Maumee Valley Railways & Light Company, will make extensive improvements to the system. Seven new cars will be purchased.

United Railways, St. Louis, Mo., has been authorized, through Rolla Wells, receiver, by Judge Faris in the United States Court to expend $1,227,902 for fifty new cars and to meet interest on bonds and current expenses.

New York State Railways, Syracuse, N. Y., suffered the loss of the Oneida carhouse by fire. The loss is in excess of $100,000. Four trolleys, two of the third-rail type, in use between Syracuse and Utica, were destroyed. These cars were each valued at $30,000. The building was totally destroyed.

Track and Roadway

Southern Pacific Company, San Francisco, Calif., has received permission from the Railroad Commission to relocate a spur track at grade across a county highway in the vicinity of Visalia, Tulare County.

Columbus, Delaware & Marion Electric Company, Columbus, Ohio, is making rapid progress on the new lines it is building between Worthington and North Columbus. All-steel ties are being laid in concrete and new and very heavy rail is being used. Officials say that the track will be smooth and free from defects that cause cars to sway. It is expected that the new line will be completed and ready for use before February. All of it is to be double-tracked.

Power Houses, Shops and Buildings

Pacific Electric Railway, Los Angeles, Calif., proposes to replace a manually operated motor-generator set at its substation at Strawberry Park on its Watts-Redondo line with a synchronous converter automatic 1,000-kw. set. The present 1,000-kw. motor-generator set at Strawberry Park substation is to be transferred to the Watts substation to increase the present capacity of this unit.

Puget Sound Electric Railway, Tacoma, Wash., has completed plans and will start work immediately on a new interurban station to be erected at South Eighth and A Streets, to replace the present station, which will be dismantled. Building will be of mission type, with brick and stucco exterior. It will have an arcade for the entrance to cars, and a covered parking space for motor buses. Complete, it will cost approximately $20,000.

Birmingham Railway, Light & Power Company, Birmingham, Ala., suffered an explosion of a gas pipe at its carhouse recently which did a considerable amount of damage to the offices on the second floor. The office furniture was badly scorched and burned, while all of the window glass was demolished. Officials of the company say there was a leak in one of the gas pipes and a number of men were looking for it when one of them struck a match and the explosion followed. No one was injured.

Trade Notes

Peter D. Thropp, vice-president of the John E. Thropp's Sons Company, Trenton, N. J., died on Nov. 23. Mr. Thropp was an official of the De Laski & Thropp Circular Woven Fire Company and the Eureka Flint & Spar Company. The Thropp company specializes in the making of rubber machinery.

Wilson Welder & Metals Company, New York, N. Y., is now represented exclusively in Maryland, Virginia and the District of Columbia by the Alexander Milburn Company of Baltimore. A large stock of color-tipt welding metals and plastic-arc welding machines is available at this point for distribution throughout the territory and a complete demonstration plant is in operation.

Refractories Manufacturers' Association, Pittsburgh, Pa., is sending out a printed questionnaire to be used in connection with a survey which it is organizing to obtain complete information regarding the furnaces in which refractory materials are used. All consumers of refractory brick, it is stated, will derive a certain benefit from the successful prosecution of the work and cooperation with the undertaking.

Power Specialty Company, New York, N. Y., builders of Foster superheaters, economizers and oil heating and cooling equipment, announces the opening of new branch offices in Detroit, Mich., in the Dime Savings Bank Building, in charge of L. Lanyi, and in Boulder, Colo., at 2324 Fourteenth Street, in charge of R. B. Nutting, who was formerly Chicago district manager.

Roller-Smith Company, New York, N. Y., announces the appointment of the Electric Material Company as its agent in the state of Washington and parts of Oregon and Idaho. The Electric Material Company has recently opened an office in the Hinckley Building, Seattle, and will handle the Roller-Smith Company's lines of electrical instruments, circuit breakers and radio apparatus in that territory. The Seattle office is in charge of R. F. Robinson, who has been engaged in the electrical industry since 1905, when he was graduated from the University of Wisconsin with the degree of electrical engineer. The Electrical Material Company's main office is at 589 Howard Street, San Francisco, and it also has a branch office in the Title Insurance Building, in Los Angeles. Roller-Smith apparatus is handled by both of these offices as well as the Seattle office, which means that the Electric Material Company represents the Roller-Smith Company along the entire Pacific Coast.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., received during the month of October contracts for power apparatus aggregating more than $3,500,000. This shows a marked increase in the total sales of previous months and, according to the company, indicates a definite trend toward a revival of business in the electrical industry. Among the concerns from which the contracts were received are the Georgia Railway & Power Company, Union Traction Company of Indiana and the Ohio Public Service Company.

New Advertising Literature

Heine Boiler Company, St. Louis, Mo., has issued an attractive folding pamphlet called "Talk, Talk, Talk versus Coal Production." The pamphlet tells what the Heine boilers are doing all over the country in helping the industry "to carry on" during the coal strike.

General Electric Company, Schenectady, N. Y., has issued Bulletin 44,018, called Metropolitan and Elevated Systems, which presents from an engineering viewpoint the principal characteristics of several great rapid transit systems. The facilities for power production, transformation, transmission and utilization are outlined briefly for each of the systems in the cities of Boston, Chicago, New York and Philadelphia.

Combustion Engineering Corporation, New York, N. Y., has issued two pamphlets entitled "The Coxe Stoker" and "Service." The larger bulletin on the Coxe stoker covers particularly the performance of this stoker on Western and Mid-Western bituminous coals. A number of test reports, each accompanied by corresponding curves, are included. These tests show very remarkable results and because they are complete in every respect they will be of considerable interest to the engineering world. The "Service Bulletin" will be of value to all stoker companies. This booklet presents the stoker manufacturers' side of the question and shows why a proper charge for real stoker service would not only be fair to the recipient but would be to his advantage. It is illustrated with an interesting cartoon story.

The Engineer as an Industrial Leader

A SIGNIFICANT feature of the annual meeting of the A.S.M.E. in New York this week was the attention given to the economic and human side of engineering. An evening session was devoted to it and the same topic was emphasized in the presidential address of Dean Kimball, who strongly urged engineers to acquire a broader knowledge of human nature and the economic principles of industry and commerce. With this equipment he visualized the engineer as possessing many of the attributes for leadership in the modern state, which are lacking in the military man, the lawyer and the financial business men. Through the progress of civilization each of these types has successively been most prominent in directing human affairs, but with the growing technical complexity of modern life the rôle of industrial manager is being forced more and more on the engineer.

The changes that Dean Kimball described are evident in individual industries as well as in business in general, and the railway industry is no exception. Mass production is the order of the day in manufacturing, and the application of engineering principles in mass transportation are no less necessary in our large cities. When a transportation line consisted of a few miles of track and cars almost any one could direct its affairs. The next step was the consolidated property, for whose creation the banker and lawyer were necessary. But the main problems in city transportation now are not simply those of finance or law. The aid of the engineer is being sought in their solution to a greater and greater degree. The problems of finance and law remain, but they are becoming equaled by if not subordinated to those of equipment design and traffic movement. The chief executive in many of the largest electric railway properties now, in London and New York for instance, have risen to those positions through the engineering or transportation sides of the service rather than that of banking and law, and the same condition applies to many other properties.

Thus electric railway progress seems to be along the normal lines of development indicated by Dean Kimball.

The Charles A. Coffin Foundation— A Noteworthy Event

THE establishment by the General Electric Company of the Charles A. Coffin Foundation announced this week is most praiseworthy. It commemorates in a suitable manner the activities of one whose services in establishing the electrical industry on its present firm foundations have been of great value, and it encourages in a definite way advances in the application of electricity to the service of man. The electric railway industry is especially interested in this endowment, partly because Mr. Coffin has always taken a keen interest in technical improvements in railroad motive power from the time that the original Thomson-Houston Electric Company acquired the Van Depoele patents, and partly because the foundation specifically provides for an annual award to that electric railway company "which, during the year, has made the greatest contribution toward increasing the advantages of electric transportation for the convenience and well-being of the public and the benefit of the industry."

The four groups designated in the deed of gift for recognition by awards were well selected. They represent, first, the men in the employ of the General Electric Company, outside of its officers, heads of departments and others occupying similar executive positions, who make the most signal contributions toward the increase of the company's efficiency or the progress of art. Then come the two large electrical industries with which Mr. Coffin's activities as president of the General Electric Company and chairman of its board of directors were most intimately associated, namely, the electric railway and electric light and power. Then there is the fourth purpose of the foundation, the expansion of technical research. This is encouraged by annual awards to technical graduates who continue their research work in electricity, physics or physical chemistry, and to technical schools to expand their research work along these lines.

The Charles A. Coffin Foundation is a noteworthy gift to electrical science, typical in its generosity and broad nature of the man whose name it bears.

Time Control Not the Last Word in Handling Traffic

THERE seems to be a great tendency to praise and to copy the three-light signal and time-element control of the traffic on and across Fifth Avenue, New York City, without much consideration of how well it aids traffic in New York, or would help elsewhere. The Fifth Avenue system is rather spectacular, and it probably attracts attention because of its uniqueness. But as to facilitating the movement of traffic, that is more fiction than reality.

During the hours of the day when travel is very heavy, the system may serve to speed up traffic on this main north and south artery, but this is done at the expense of the crosstown travel, which is very much slowed up, as compared to the usual system of control. In the hours of lighter travel, the speed on Fifth Avenue is itself slowed up by the time-element control system, for the period of travel in one direction is determined by the conditions at Forty-second Street, the heaviest crosstown street. The result is that for long stretches of time often no use is being made of the other intersections all along the avenue, while many north and south vehicles wait patiently for the signal. Certainly an efficient use of the crossings cannot be claimed for the Fifth Avenue system.

Furthermore, the adherence to a certain time element in changing direction of travel has spread to several other thoroughfares in New York, for the policemen follow the scheme even without the signal lights. The result is a slowing up of traffic generally, as compared to other large cities where the officer handles the traffic in shorter "takes" and does not wait for any time period to lapse before permitting the vehicle from the other direction to go, if the way is clear.

Do Motormen Realize that They Are Custodians of Valuable Property?

WHEN a man takes his place at the front end of his car and puts the car in motion he assumes responsibility for the safety of the car riders behind him and for the preservation of his employer's property. A realization of this fact cannot but tend to lend dignity to the position of motorman and thus promote the incumbent's self-respect. It should also make him careful, and carefulness is needed now as never before because of the congestion of street traffic by automobiles and the recklessness with which many of those vehicles are driven. The alarming increase in the rate at which vehicles are colliding with cars indicates an unusual need for caution.

It is true that a large part of the collisions between cars and automobiles are due to carelessness of the drivers of the latter. At the same time it is up to the motorman, who is a responsible employee of an established public service corporation, not only to avoid causing collisions himself but also as far as possible to prevent less careful drivers from running into his car.

Aside from the urgent and primary duty of minimizing injury to persons, which is "another story," the motorman has it in his power to safeguard costly physical equipment. If he is on an interurban car the value of this may run to $30,000 or more. It is difficult to visualize just what this means. That amount of money in real estate or grocery store stock would make quite a show. And a motorman on a train has behind him several times this value, possibly a quarter of a million dollars. Even when it is an inexpensive safety car that is being operated the principle is the same. Besides this, the motorman also in part determines the life of switches, crossings and other special trackwork, which also are more expensive than he usually realizes. It would be well for managers to impress the above line of thought upon their men at this time as a part of the campaign against the accident evil.

Higher Salaries Will Bring Young Men to the Industry

QUITE a lot of thought has been given to ways of interesting more young men in the electric railway business, particularly on the part of the A. E. R. A. committee on education. It was suggested that apprenticeship courses be revived, that joint study and practical work be arranged between technical schools and railway companies, etc. However good the suggestions of the committee may be, they are likely to avail little until a fundamental deficiency in this field is remedied. Probably the most pertinent reason why young college men are not coming to the electric railway field more plentifully is that they are not paid enough. In fact, the average run of salaries throughout the industry is lamentably low. In comparison with the electric railway field the inducements that come to these energetic young men from other industries include not only the interest of rapidly expanding fields but more money right from the start and in the future, if the man shows capabilities.

This is certainly not as it should be. Considering the great opportunity in the electric railway field for brains and skill to make tremendous savings, or the lack of them to make ruinous losses, there ought to be sufficient compensation to attract and hold the very best of talent. Taking into account the demands imposed on a man by seven-day, twenty-four-hour service to the public, the compensation ought to be relatively higher than in other lines where the conditions are less exacting.

Knowledge of this salary situation somehow penetrates college circles and the young men shy at apprenticeships in railway work (at small pay) and hire out to the automobile, the general manufacturing, or some other field.

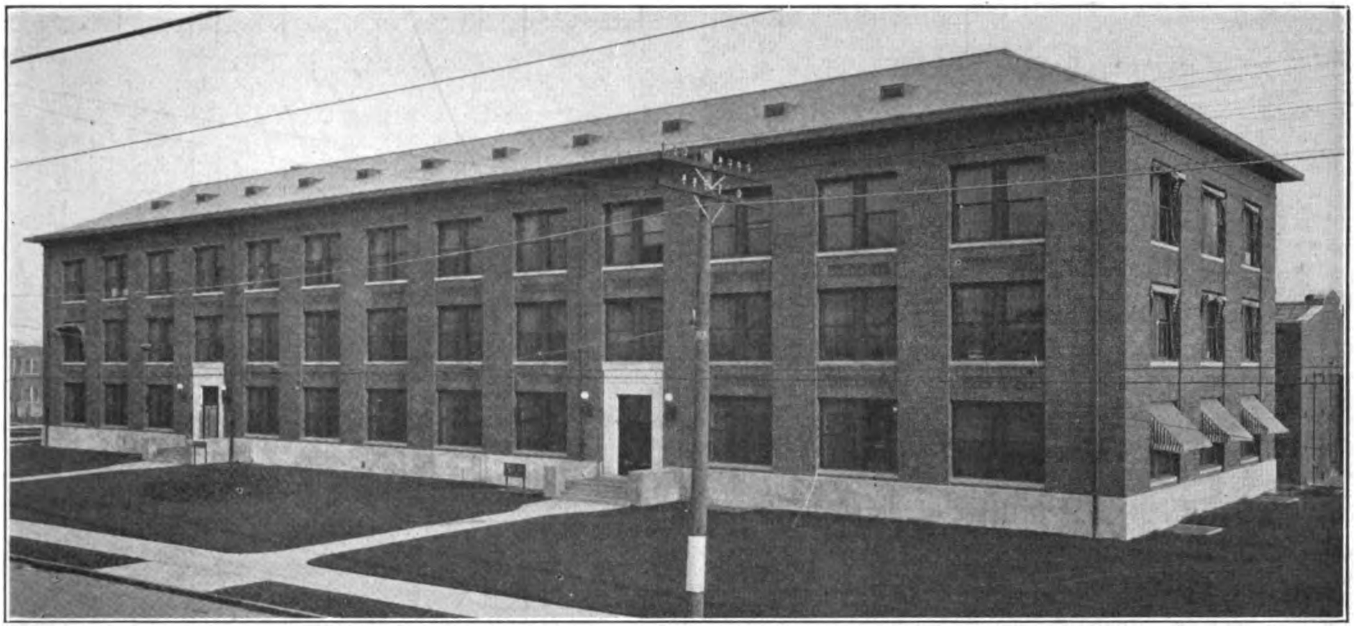
The whole level of salaries of electric railway operating heads and their assistants is too low, on some roads ridiculously so. It is apprehended that if data were available for a comparison of the general rise in electric railway salaries as compared to the trend in level of wages in the field it would make it appear that brain is much less appreciated than brawn. Taking into account this condition, it is not altogether surprising that the personnel on some roads is failing to measure up to the opportunities. The good men in many cases have gone to better paying fields, for the salary situation not only deters the best young men from entering the field but makes it difficult to hold good men. The corrective measures are obvious.

While Others Talk Subway Rochester Quietly Builds One

THE city of Rochester, N. Y., is exhibiting initiative and foresight in utilizing the bed of the abandoned Erie Canal for subway purposes. Little publicity has as yet been given to the subway development in this city; there has been no blowing of horns about what was going to be done. At the same time construction has been going ahead at a good pace, as is evidenced from the construction pictures reproduced elsewhere in this issue. There will be in the subway accommodations for two interurban tracks and two freight tracks, with necessary sidings; the freight trains, of course, to be moved by electric locomotives. These facilities will greatly relieve congestion in the streets and permit higher speed to be made by the interurban cars. Further, the roof of the subway will be a broad street, which will further improve street transit conditions.

This work is facilitated by the fact that the canal site could be occupied exclusively for construction purposes, a condition not usually met in subway construction. This condition also largely eliminated interference with street traffic, which is one of the bugaboos of subway work in large cities.

The site of the abandoned Erie Canal presents an interesting problem in several cities. Its route lies naturally through their business and manufacturing districts, because the cities were built up commercially along the line of the canal. Hence the canal site presents great possibilities in the way of civic improvements. Rochester is utilizing her section by making a subway of it. In near-by Lyons the track of the Rochester & Syracuse Railroad, a high-speed interurban line, has been removed from the main streets to the bank of the old canal, permitting much faster and, therefore, better service through the town.



New General Office Building Which Houses All Departments of Detroit Municipal Railway

Detroit Street Railway Moves Administration Center to New Buildings

Office Building, Car Storage Yard and Inspection Shop and Track and Line Building Located on 14-Acre Plot in Outlying District —Many Interesting Features in Design and Layout of Facilities

A RECORD of the progress made by the Department of Street Railways, city of Detroit, would be incomplete without a description of the new buildings which were erected during 1922 for office and shop use. A plot of land of approximately 14 acres was used. This extends from Shoemaker Avenue to Warren Avenue in one direction and from St. Jean Avenue to Lillibridge Avenue in the other. The buildings erected consist of an office, carhouse, heating plant and building for the track and line department. The original plans also provided for the erection of a large car shop, but when the city took over the Detroit United Railway property last May it was decided to use its shop and not erect a new maintenance shop at the present time.

The office building faces on Shoemaker Avenue and is a three-story and basement building, 217 ft. 9¾ in. long by 61 ft. 9 in. wide. It is made of rough, red-faced brick, and the concrete walls of the basement extend to the bottom of the windows of the first floor. This adds materially to the fine appearance of the building. The front line of the building, which faces north, sets back 50 ft. from the street and this space, as well as large areaways at each end, is devoted to well-kept lawns. Attractive buildings and surroundings are a particular asset to the city, since they insure that other buildings erected in the locality will also be of high-class construction and the revenue obtained from taxes and from the increased valuation of other adjacent property will prove an advantageous source of income. There are two entrances to the office building on the front and one at the east end of the building. One of these, that at the front toward the west, is used as a general entrance; the other two are used for employees only. The main entrance leads into a spacious lobby with tile floor and at the end of this lobby is a stairway with an elevator to serve the other floors. Corridors run lengthwise of the building on each floor, off which entrance to the various offices is obtained. The offices on the first floor are devoted particularly to the transportation department. A fire stairway which is shut off from the other parts of the building forms a part at the east end. Washroom and toilet facilities are particularly extensive, and the heating, ventilating and lighting of the building incorporate all the latest improvements in office building construction. The ventilation of the toilets and the locker rooms is particularly interesting. In the locker room a duct is provided underneath the floor with screened openings from each locker leading into this. There are other openings at the front and top of each locker so that air is led in at the top and exhausted through the bottom of the locker so as to insure a complete circulation of air to carry off any offensive odors. A duct is also provided overhead in the toilet rooms which also insures very effective ventilation.

The heating pipes are brought into the office building through a tunnel which extends underneath the inspection shop and has a branch leading to the line and track department building. This tunnel has a cross-section of 5 ft. x 7 ft. and its location is shown in the accompanying layout of the buildings and yards.

The floor and base construction used throughout the office building is of particular interest, as extreme care was used in the design to provide round sanitary corners and provision for washing without danger of damage to the walls. The floors are of cement, slate, tile or linoleum and the bases are of cement or tile. The

walls above the bases are of either plaster, tile wainscot, marble or a solid plaster preparation. A few cross-sections shown will give an idea of the construction.

The second floor is devoted to offices for the various officials. These include the general manager with various assistants, the superintendent of equipment, electrical engineer, supervisor of supplies, and the superintendent of transportation. The auditing department also occupies rooms at the west end of this floor. The principal part of the third floor is taken up by the auditor's department, the supervisor of supplies, and the claim department.

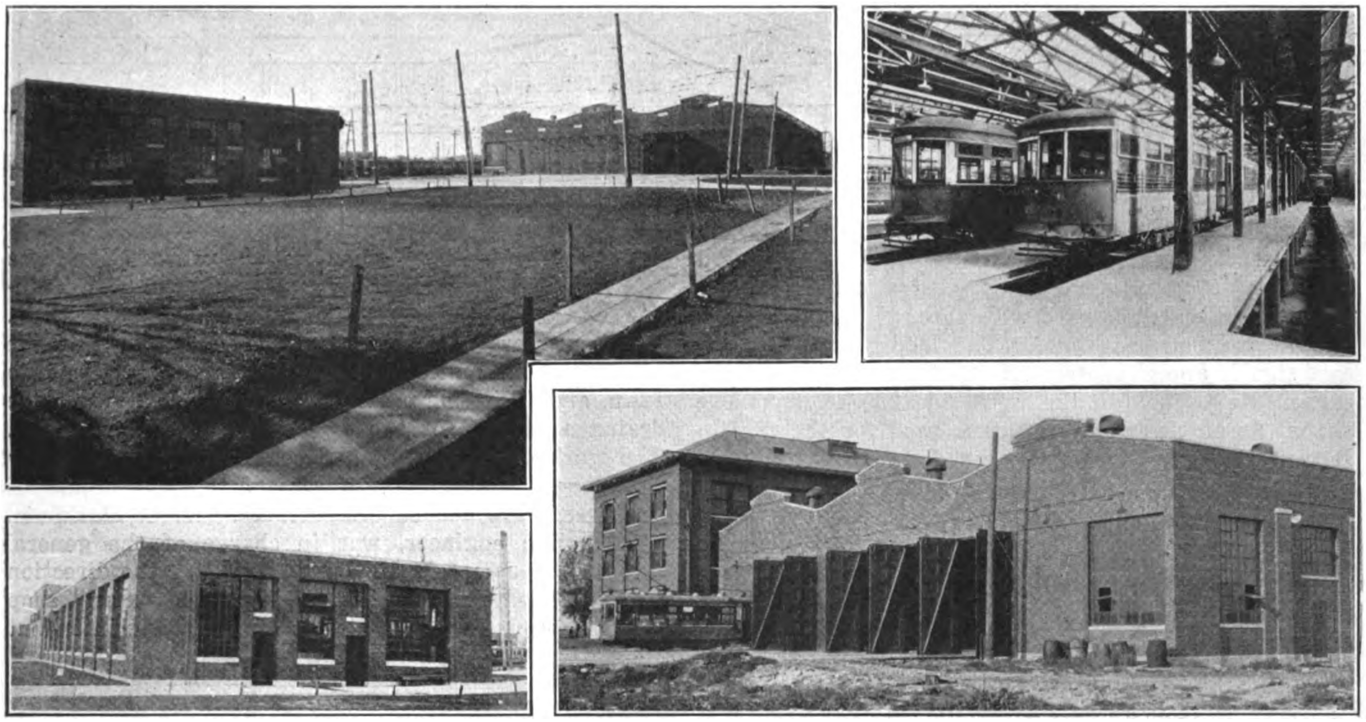
CARHOUSE CONSTRUCTION

The carhouse occupies a space of 124 ft. x 216 ft. immediately back of the office building. This is constructed with three bays. The center bay is 40 ft. wide and the outside bays 42 ft. and 40 ft. respectively. A space on the south side of the building 20 ft. wide and running the entire length is partitioned off for use as an office, storeroom, machine shop, oil room, sand room and toilet. A particular feature of this is that the wall which separates these departments from the inspection shop extends up only to the roof truss. This is of particular advantage as this construction does not shut off any of the light, as would otherwise be the case.

Provision has been made throughout the construction to provide plenty of light, and one of the outstanding features is that of the roof construction. Fifty per cent of the roof is skylight, and the remainder is concrete slab covered with Barrett roofing. The entire construction throughout the carhouse is fireproof, steel concrete and brick being used. In the layout and arrangement of facilities, many improvements utilized in modern carhouses throughout the country have been incorporated in the design and construction. In order to provide for the use of chain hoist for hoisting car bodies or lifting equipment, the roof truss is figured for a 1-ton load at each panel point on the lower chord.

There are seven tracks running through the building, each being provided with a pit for the entire length. The tracks are located with a center to center distance of 13 ft. 4 in. and the pits are 5 ft. deep.

The floor and pit construction is of particular interest. It consists of structural steel support piers incased in concrete. The track rails are used as the top members. The concrete between adjacent tracks is supported by partitions and not by the rail. The rail, however, which is 7-in. 91-lb. T-rail, forms the support for the cars. The supporting piers are located at 8-ft. centers and passageways are left between these to give free access to adjacent pits. The inner rails of adjacent tracks are supported in pairs by vertical structural steel members diagonally braced. Two angles 2½ in. x 3½ in. x ¼ in. are used for the vertical members, and angles of the same size serve for diagonal braces. This construction leaves the pit entirely unobstructed and gives a very satisfactory arrangement. Accompanying cross-sections and photographs will give a clear idea of the construction used.



NEW BUILDINGS AND YARDS OF THE DETROIT MUNICIPAL RAILWAY

Upper left—View of ground showing shop and building for line and track department.
Upper right—Interior of shop showing pit construction.
Lower left—Line and track department building.
Lower right—End of shop showing three-unit construction, with office building adjacent.

Heating is provided by radiators installed between adjacent pits, there being eighteen radiators in the entire length of the building between two pits. The steam mains are brought into the building through a tunnel as already referred to, and this tunnel extends through the center of the shop and runs to the office building. The system of steam pipes and fire lines has been worked out very carefully.

The door construction has not followed the usual practice for electric railway shops, which is that of using rolling doors for carhouses. Each track of the Detroit shop is provided with two swinging doors, which open outward.

FLOOR PLAN OF CARHOUSE

The track layout for the carhouse and storage yard is shown in an accompanying illustration. A ladder track arrangement is used with through tracks the entire length between these. The ladder track at the east side is approximately 120 ft. from the end of the carhouse and that on the west side 230 ft. from the shop. As single-end operation is used for the cars in Detroit the track facilities were designed particularly to handle this type of equipment. The scheme in general provides for cars to enter from Shoemaker Avenue, although on the east end there is also a connection to St. Jean Avenue. Cars which are to pass through the carhouse for inspection or light repairs can proceed in either direction from the ladder track, either from the street or storage yard, and after passing through the house completing the loop they can be returned to any desired location. The arrangement of the track layout, while providing a complete loop for either the storage yard or from the street, also gives facilities so that cars can be turned without interfering with regular traffic through the use of the Y provided at the entrance to each end of the carhouse yard. The yard has been designed with pavement which insures cleanliness and provides favorable working conditions. The drainage has also been carefully worked out. Five 6-in. drains are provided between tracks lengthwise of the yard. These connect the cross drains which lead to 12-in. and 18-in. main sewers. The latter also provide drainage outlets for the carhouse and office building. The work of excavating and constructing foundations was done by contract by forces of the department of street railways and superstructures. W. C. Markham, construction engineer, was in charge of the general layout and supervision of this work under the direction of J. S. Goodwin, general manager. The general shop facilities were developed by A. C. Colby, superintendent of equipment.

CROSS-SECTION TO SHOW SHOP CONSTRUCTION

Repair Shops Nearly Double in Size in Five Years

THE fourteenth United States census of manufactures gives some very interesting facts on the growth of electric railway repair shops in a bulletin just issued by the Department of Commerce. In 1919 the value of the materials used and amount of wages paid had more than doubled over the figures in 1914, and while the value of the products had not increased in quite the same ratio, it was almost 200 per cent of that in 1914. The figures for 1919, 1914 and 1909 follow:

ELECTRIC RAILROAD REPAIR SHOPS

	1919	1914	1909
Number of establishments	624	649	541
Persons engaged	33,120	28,215	23,699
Primary horsepower	53,830	44,989	35,794
Capital	$82,557,905	$63,613,741	$38,898,686
'Salaries and wages	42,052,521	20,559,383	15,690,228
Salaries	2,979,367	1,914,538	1,204,219
Wages	39,073,154	18,644,845	14,486,009
Paid for contract work	118,335	24,596	23,480
Rent and taxes	765,463	581,657	351,626
Cost of materials	32,025,484	17,609,574	15,167,899
Value of products	72,210,701	38,576,565	31,962,561
Value added by manufacture*	43,185,217	20,966,991	16,794,662

* Value of products less cost of materials.

Richmond Finances Analyzed

A Report Prepared by John A. Beeler for the Richmond City Council Shows a Number of Interesting Facts—Economical Operating Methods Found

THE first portion of a report which John A. Beeler is preparing on the Richmond Railway division of the Virginia Railway & Power Company has just been made public. It contains about 7,500 words and many tables and relates to the financial condition and history of the company. A second part will follow on capital accounts and investment in connection with the valuation of the property, while service and operating methods will be considered in a third volume. The report is being made by the Beeler Organization for the committee on streets of the Richmond City Council. Among other interesting facts disclosed by the report it is found that the Richmond Railway division is making an operating profit on total operating revenues of only about 33 cents a car-mile, in spite of the fact that its taxes amount to nearly 10 per cent of its gross receipts.

TABLE I—INCOME STATEMENT, RICHMOND RAILWAY DIVISION

Year	Gross Earnings	Operating Expenses	Net from Operations	Operating Ratio
1910	$1,237,274.24	$836,475.21	$400,799.03	.676
1911	1,341,330.71	880,619.24	460,711.47	.657
1912	1,380,043.66	947,414.45	432,629.21	.687
1913	1,473,555.72	953,185.07	520,370.65	.647
1914	1,487,579.47	983,939.67	503,639.80	.662
1915	1,390,708.27	953,719.44	436,988.83	.686
1916	1,526,357.19	1,073,340.67	453,016.52	.704
1917	1,597,777.78	1,154,196.01	443,581.77	.722
1918	1,657,895.52	1,370,559.00	287,336.52	.826
1919	1,939,050.24	1,698,869.32	240,180.92	.876
1920	2,321,559.61	2,064,487.35	257,072.26	.889
1920 *a*	1,345,027.33	1,298,111.19	46,916.14	.965
1921 *b*	2,553,284.76	2,441,734.97	111,549.79	.956

a Six months period ended Dec. 31.
b Fiscal years ended June 30, except 1921 ended Dec. 31.

Mr. Beeler finds the income during the last twelve and one-half years was as shown in Table I.

Almost the entire operating receipts of the company are derived from passenger earnings. Other sources of revenue, totaling less than 1 per cent, are chartered cars, advertising and minor items. From July 1, 1908, to Feb. 13, 1919, the fare was 5 cents, with tickets sold at the rate of six for 25 cents, good any time, and labor tickets good before 7 a.m. sold for 2½ cents. From Feb. 14, 1919, to July 31, 1920, the fare by cash or tickets was 5 cents and labor tickets were sold six for 25 cents. Since Aug. 1, 1920, all fares have been 6 cents.

TABLE III—EXPENDITURES FOR MAINTENANCE OF WAY FOR LAST TWELVE AND ONE-HALF YEARS

Year	Current Maintenance	Per Cent of Gross Revenue	Cents per Car-Mile	Track* Mileage	Average Maintenance per Track-Mile
1910	$81,388.25	6.58	1.40	69.270	$1,175
1911	84,405.90	6.29	1.43	69.270	1,218
1912	103,849.83	7.53	1.73	*c* 71.430	*c* 1,454
1913	104,654.19	7.10	1.74	72.714	1,439

* From annual reports to stockholders
a Six months period ended Dec. 31.
b Fiscal years ended June 30, except 1921 ended Dec. 31.
c Mileage is given in annual report as 81,430.

Table II shows operating revenues and expenses for the period in cents per car-mile and cents per car-hour.

Mr. Beeler finds that the maintenance of way has been kept up well as shown by Table III. A considerable part of the increase, as compared with the early years, is undoubtedly due to the increase in material prices and labor rates. The figures for maintenance of equipment are shown in Table IV. The figures for the last two or three years undoubtedly in equipment maintenance include some deferred maintenance and this account should now be lower. Power is obtained at cost from the light and power division of the company. Conducting transportation cost last year 39.81 per cent of the gross earnings and 41.69 per cent of the operating expenses. Nevertheless the rate of wages paid has been very conservative in comparison with those that are paid in other cities. Table V gives the figures since 1910.

"General and miscellaneous" were 18.1 per cent of the gross earnings and 18.9 per cent of operating expenses. The figures given in the report included only $12,655 chargeable to the railway division for the

salaries of president, vice-presidents, general counsel, assistant general counsel, secretary and treasurer, assistant secretary and treasurer, auditor, general manager, purchasing agent, electrical engineer and assistant engineer. These charges are considered by Mr. Beeler as "remarkably small for a company doing its business. Had the property been operated as a separate unit it would have been necessary to have an independent set of officers and clerks, which would have cost much more than under the present arrangement. It is possible, of course, that such an organization, while costing more, might have obtained greater attention to the problems of the railway system, but this is problematical."

Injuries and damages for a number of years were charged at 5 per cent, but at 7 per cent from July 1, 1920, to Dec. 31, 1921. It was then decreased 5 per cent.

A depreciation reserve was begun July 1, 1909, and since July 1, 1911, 6 per cent of the gross has been charged to that reserve. This basis is not considered by Mr. Beeler so desirable as one on historical accumulated investment. On such a basis, for the conditions in Richmond, Mr. Beeler considers 2½ per cent proper. During the last three years this would have corresponded pretty closely to the amount actually accrued, but prior to that time the amount accrued by the method then followed by the company would be very much less. The taxes in 1921 were 9.6 per cent of the revenue, which is considered high.

TABLE V—EXPENDITURES FOR CONDUCTING TRANSPORTATION FOR LAST TWELVE AND ONE-HALF YEARS

a Six months period ended Dec. 31.
b Fiscal years ended June 30, except 1921 ended Dec. 31.

TRAFFIC STATISTICS

The revenue riders have increased 31 per cent in eleven and one-half years in spite of the increase in fares. The car-miles have increased over 32 per cent, though the speed has not shown any change of moment. While the revenues of the Richmond division have increased approximately 100 per cent in the past twelve and one-half years, the net earnings have decreased 75 per cent.

Transit Commission Standardizes Time-Table

After an Examination of Time-Tables Used in Many Cities, a Standard Form Is Recommended by the New York Transit Bureau

THE New York Transit Commission has found that the time-tables of the various surface railway companies in New York City vary widely, and for no adequate reason. As the object of all is the same, to guide transportation employees in the operation of cars, it is thought that a standard form of time-table will be of advantage not only to the companies but to the Transit Commission as well. In consequence the commission has proposed to the companies to adopt the standard form, illustrated herewith. An explanation of this time-table, as compiled from the report submitted to the commission by Edward A. Roberts, its chief of transit bureau, follows:

A time-table may be divided into the following four parts: (a) The heading, (b) The details of runs, (c) The run guide, (d) Information on running time, time points and headways.

The heading is a simple statement giving the name of the line, serial number of the time-table, date in effect, serial number of the superseded time-table, terminals of the line and a brief statement of the route followed. It is also desirable to show in the heading the name of the operating company, and the carhouse from which the line is operated.

The details of runs is the major part of the time-table and shows the time that each car or crew starts out of the carhouse, the time it leaves terminals on each trip, and the time the car goes back into the carhouse or is turned over to another crew. The details of runs usually occupies the upper left section of the time-table. The variations in the details of runs on different styles of time-tables in New York City are:

1. The movements of individual cars or crews are written horizontally on some tables, vertically on others.
2. The continuous columns of either horizontal or vertical figures represent in some tables the day's movements of an individual car, and in others the continuous day's work of a crew.
3. There are variations in the symbols and abbreviations used to denote certain standard car movements, such as "car is taken out of barn," "crew is relieved," etc.

The run guide usually appears in the upper right section of the time-table. It is a summary of working hours, showing for each crew the time for reporting to work, the time for relief from work, and the total hours of the day's work. The manner of stating this information varies slightly with different companies, due to variations in the form of the details of runs.

The miscellaneous information is generally placed in the lower part of the time-table. No general information at all is presented in the time-tables of some companies, whereas a complete statement should include: running time, time points, explanation of symbols, summary of intervals between cars at all periods of the day, and number of cars required for operation at various periods of the day.

On many street railways in New York City the use of a formal time-table is comparatively recent.

The time-table drafted by the commission is based on an extended study of time-tables used in different cities, and of the recommendations of the time-table committee of the American Electric Railway Transportation & Traffic Association. Hence, no claim for originality is made for it, as it consists simply of what were considered to be the best features of the large number of time-tables examined.

The details of runs are read horizontally, and each section of the details of runs represents the movements of an individual car or train during the day. The movements of each individual crew are indicated by run numbers written with bold figures, so that the various pieces of work of each individual crew may readily be picked from the time-table. By using this method, the time-table permits one to follow all movements of cars as well as crews, a feature which is not easily possible when each horizontal section of the details of runs refers to the day's movements of an individual crew rather than of an individual car.

The symbols used in the details of runs to indicate cars going in and out of carhouses and crews being relieved are in the simplest possible style and are fairly well recognized as standard. The indication of terminals, in connection with the work of each run, is a feature which, it is thought, will eliminate much of the mystery of the street railway time-table and make it as easily read as the ordinary steam railroad public time-table. On routes where operations are not complicated, the details of runs could be arranged on the time-table in such a way that, when read vertically, it constitutes an almost perfect headway sheet showing the time that successive cars leave their terminals.

The run guide in the recommended form is the same as on all time-tables in which each horizontal section represents the day's movements of an individual car.

The other information called for in the recommended form includes a statement showing the running time in each direction between terminals and between intermediate time points. Provision is made for varying the running time during the different hours of the day in accordance with variation in street traffic conditions. The intermediate time points, at each of which motormen are supposed to ascertain whether or not they are running in accordance with the schedule, should be spaced not more than ten minutes apart. A statement is also included in the lower section of the time-table showing the interval between cars and the number of cars in operation during all periods of the day.

CROSS-SECTION OF ROCHESTER SUBWAY AT FORMER ERIE CANAL AQUEDUCT

Rochester to Utilize Erie Canal Bed for Transportation

Passenger and Freight Service to Be Provided for in Subway Being Built in 13-Mile Section of Erie Canal Purchased by the City

THE city of Rochester, N. Y., has begun the construction of a rapid transit and industrial railway in the bed of the abandoned Erie Canal. Through the construction of the Barge Canal south of the city a 13-mile section of the Erie Canal has been vacated. This has been acquired by the city at a cost of about $1,500,000, for use as a subway.

Two tracks for passenger service and two for freight service will be constructed. Tracks will connect with all the steam railroads for transferring freight to the various manufacturing concerns along the canal. The interurban trolley lines will be diverted from the streets and the running time to outside points reduced considerably. Three main stations, located in the business section of the city, will be served by the several interurban lines.

The contract recently let to Scott Brothers of Rome, N. Y., for $1,183,780, comprises about ¾ mile. This section will be covered by a street parallel with Main Street. This street will be 60 ft. wide between curbs, excepting the portion over the Genesee River aqueduct, where the width will be 52 ft.

The trunk of the aqueduct is to be used for the

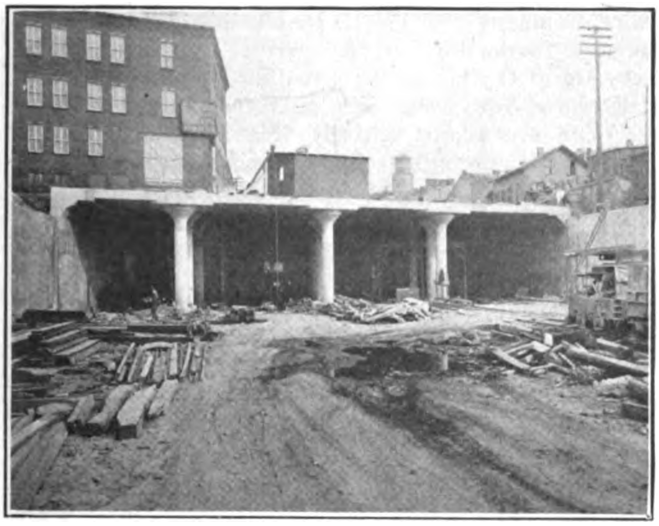
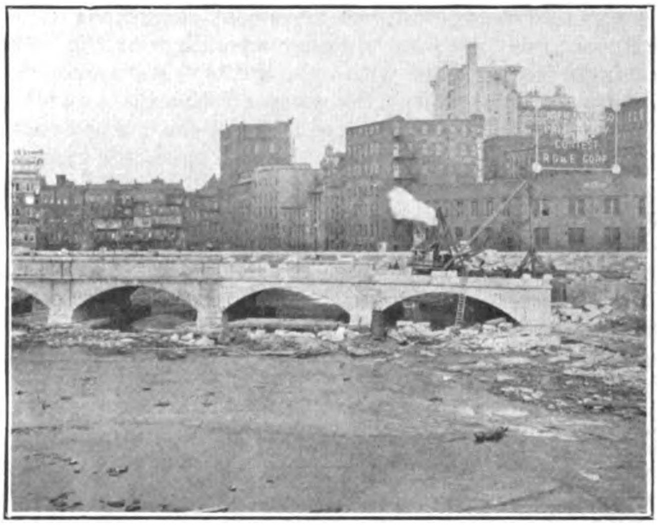
PLAN OF THE PROPOSED RAPID TRANSIT AND INDUSTRIAL SUBWAY FOR ROCHESTER, N. Y., OF WHICH AN IMPORTANT SECTION IS UNDER CONSTRUCTION



Cross-Section of Subway at Oak Street—At Left, Siding to Warehouse Above; Next, Passenger Track; Both Sides of Middle Row of Columns, Platform Main Street Station; Next, Passenger Track; at Right, Freight Track



Extending Arches of Aqueduct, Street to Be Above Supported on Graceful Short-Span Arches with Railway Tracks Laid in the Bed of the Old Canal. Cross-Section of Completed Structure Is Shown on Page 908.

tracks, the street being carried above the parapet walls. Catenary trolley construction with steel bridges will be used and the freight will be handled with 50-ton electric locomotives.

The detailed study of the project and preparation of the plan were made by LeGrand Brown, engineer of subway, under the general direction of Edwin A. Fisher, consulting engineer, and City Engineer C. Arthur Poole. Prof. George F. Swain of Boston examined and reported favorably on the entire project.

One-Man Cars for Hydro-Electric Railways

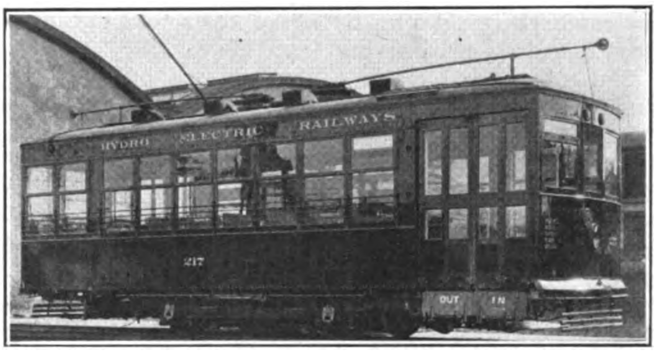
Passenger Comfort Has Been Considered as Most Essential in the New Cars, Which Have Double Doors, Long Platforms, Trucks with Long Wheelbases and Seats with Spring Cushions and Backs

THE Hydro-Electric Power Commission of Ontario has recently placed in service at Windsor and Guelph, Ontario, twenty-five one-man cars. The car bodies and trucks were furnished by the Canadian Brill Company, and as several departures in design have been made from the Birney safety car, a review of the new features will be of interest. A seating capacity of thirty-four has been provided and in addition there is comfortable standing room for thirty passengers. The cars are double ended and weigh, completely equipped, 26,175 lb. This is approximately 10,000 lb. heavier than the Birney car and when consideration is given the features which go to make up this increased weight, it is evident that the question of light weight and low power consumption were not regarded as of so great importance as that of passenger comfort. The cars are mounted on Brill No. 79-E-2 trucks, with a 9-ft. wheelbase, and 26-in. diameter wheels. In general appearance, the cars are quite similar to the Birney cars, but are of increased dimensions and weight. The seats are of the Brill "Waylo" reversible type and have spring cushions and backs with rattan covers.

Some Features of the Door Control Equipment

The Hydro cars are of the two-stream type having separate entrance and exit doors and steps. These are selectively controlled by the operator by means of the brake valve handle and the Westinghouse "selector valve." Either door may be operated separately or both doors may be operated simultaneously. This selective control gives the motorman command of the situation and prevents passengers from boarding through the exit door. It is also a vital factor in the conservation of heat, which is a most important consideration during the Canadian winters. At approximately 75 per cent of the stops, only one-half of the total doorway (either the entrance or exit, as the case may be) is opened.

The folding door and step mechanism is the National Pneumatic Company's standard ball-bearing type throughout, and embodies all of the latest improvements. The engines are mounted in a pocket above the doors, which protects them from dust and dirt, and also reduces the possibility of freezing due to the high drainage position. They are mounted on a steel base plate and bolted through the header. The door shafts pass up through this steel base plate and the door shaft top bearings are riveted to the plate, the engines being connected with rods less than 2 ft. long. This base plate construction makes the engine and the door shafts a complete mechanical unit which will operate properly regardless of vibration. The door-shaft mechanism is ball bearing with taper-thrust collars which allow free movement even though the car platforms may sag or twist and throw the equipment out of line.

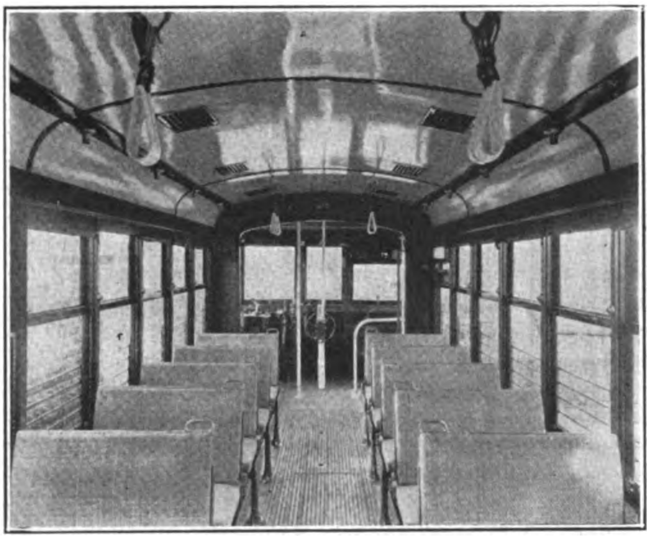


Double-Door Openings Are a Feature of the Hydro-Electric Cars

The folding step mechanism is also ball bearing with the same advantage of free movement should the step be knocked out of line. Another advantage of the ball bearings is the ease with which they are renewed. The thrust collar keeps the wear off the shaft, while with a plain or sleeve bearing both the shaft and housing wear. The step mechanism is connected to the door shafts by means of the National Pneumatic Company's slide bar device, which insures perfect adjustment when new and provides for adjustment to take up wear from time to time as required.

The engine connecting rods are connected to the door shafts through adjustable levers, which provide for perfect adjustment of doors both open and closed and the proper movement of both doors in unison. These levers also provide for taking up the slack due to wear so that the doors may be kept in the same operating condition regardless of the length of time the car is used.

The bottom door guides and catches insure the proper locking of the doors at the bottom, keep the door panels from twisting and are so designed that passengers will not catch their clothing or strike their toes or knees when boarding or alighting from the car.



Reversible Type Seats Have Spring Cushions and Backs

The control and motor equipment was built by the English Electric Company of Canada, Ltd. Two D.K.84-A, 40-hp., 600-volt ventilated box frame motors are used. These motors are of the standard English Electric design arranged for mounting on axles up to 5 in. in diameter. They are of the four-pole series-interpole type and are self-ventilated by a fan mounted on the armature shaft at the pinion end which produces a dual flow of air through the machine, one current passing through the armature core and the other along the surface of the armature and through the field coils. The frame being of the box type, the motor leads are brought out on the suspension bar side, the two armature leads at the commutator end, and the two field leads at the pinion end. Among other desirable features to be found in the motor is the type of brushholder, which is provided with a serrated clamping face, thereby securing absolute rigidity and making it impossible for the holder to slip down on to the commutator. The interpole and main field coils are secured against movement by the insertion of a flat spring between the coil and the frame, the coil being protected by a sheet steel tray.

The gears were supplied by the Tool Steel Gear & Pinion Company and the R. D. Nuttall Company, each company furnishing 50 per cent of the order. The gears are of the helical type, the teeth having a 7½ deg. angle and a 5-in. face. The gear cases are of pressed steel, and are almost entirely free from any riveting or welding, the weight complete being 70 lb.

The controllers are standard Dick-Kerr system two-motor controllers, for use with the Safety Car Devices' apparatus, and are supplied with standard notching device and Zweigbergh patent magnetic shield blow-out coil. The winding of the blow-out coil is short circuited on the two running positions, thereby preventing overheating of the coil. The power and reverse drum segments are built up on square steel spindles which are insulated with a thick covering of mica, a maximum amount of clearance being provided between segments, so as to facilitate cleaning and to overcome the depositing of greasy dust. The cutting out of the motors is done by a crank at the back of the controller, which is operated by the reverse key and which raises or lowers the reverse drum, the movement cutting out either No. 1 or No. 2 motor as desired.

DIMENSIONS OF THE HYDRO-ELECTRIC ONE-MAN CARS

Length over bumpers	30 ft. 3⅜ in.
Length over vestibules	29 ft. 3⅜ in
Length over body	17 ft. 7⅜ in.
Height from underside sill of top of roof	8 ft. 3 1/16 in.
Height from rail top to roof	10 ft. 4 1/16 in.
Height from rail top of trolley boards	10 ft. 7 11/16 in.
Height from rail top of car floor	29 11/16 in.
Height from rail top to first step	14 ½ in.
Height from first step to platform	13 ⅜ in.
Ramp in floor	2 1/16 in.
Width over all	8 ft. 6⅜ in.
Width over side sheets	8 ft. 4 in.
Width of aisle	28 ⅜ in.
Door opening both ends	4 ft. 6 in. clr.

The circuit breakers are of a standard English Electric design and are for mounting in the vestibule roof. They are type "D," form "A" and have a continuous current capacity of 100 amp. The frame of the breaker is of cast iron, the contacts and arc tips being contained in a chamber of molded insulation. All working parts are of cast brass. A main contact and arcing tip is provided and the breaker is so designed that the arc tip makes before and breaks after the main contact brush, which is made up of laminated copper strip. The whole breaker is covered by a black japanned cover with polished brass lettering.

Automatic Substation with Remote Control for New York Central

THE New York Central Railroad has contracted with the General Electric Company for the first automatic substation installation to be used on its electrified division. While the equipment furnished will provide for full automatic operation, the operator at Mott Haven substation will have the new station under his supervision through pilot wires providing for remote control. This equipment will furnish power for train operation at a point where the growth of traffic developed a load center which did not exist at the time of the original installation.

The new substation will be located beneath the elevated tracks at 110th Street and Park Avenue, near the point where they emerge from the Park Avenue tunnel.

The equipment will consist of a 2,000-kw. motor-generator set operated directly from the 11,000-volt transmission, and with the generator tied into the 660-volt third-rail system.

The set may be floated on the line all day or closed down during the periods of light traffic, at the discretion of the operator at the Mott Haven Junction substation. To start the station the operator simply operates a control switch and the automatic control in the new substation takes care of starting the motor-generator set and bringing it onto the line. He can follow the output of the machine and its load conditions at any time of the day and, from his knowledge of train movements, he is in a position to know when the set may be unnecessary. Indicating equipment on his meter panel gives another check on the line load.

In the event of a service interruption, due to failure of the high-tension supply, the automatic station will of itself shut down and be ready to come onto the line again with the resumption of service from the power station.

The automatic station control is laid out so as to present the characteristics of a constant-current generator, in that the control can be adjusted so that the generator will supply continuously any value of current below the rated output for as long as the operator may anticipate the concentration of load will continue, or for such a period as is possible without overheating.

Preparing for Snow in Boston

There Is a Heavy Snowfall Annually and the Company Has to Remove Much of the Snow as Well as Clear Its Tracks—Increasing Dependence Is Being Placed in Machinery, Particularly Tractors

RAILWAY TRACTOR HAULING ROAD WAGON TO BREAK UP ICE ON STREET

THE Boston Elevated Railway has long been required on narrow streets to remove the snow which it cleared from its tracks and not simply to push it to one side. This requires a much more extensive organization than in cities where the company needs simply to run a sweeper or plow over the track and let the city take away the surplus snow. This year a slightly different plan will be followed as the result of an arrangement made with the city authorities. Certain streets have been definitely set aside which the company will clear from curb to curb, while on other streets the city has undertaken to remove the snow which the company clears from its tracks.

Boston has a heavy snowfall in winter and formerly the Boston Elevated Railway owned a large number of horse-drawn sleds for hauling away the snow. Latterly greater dependence has been placed on gondola cars and auto trucks, but the greatest development during the past two years in snow-fighting equipment has been with tractors and other snow-fighting machinery. The company is entering this winter with the following snow-fighting equipment:

Sweepers: Two single-truck, 14 double-truck. Plows: Wason, 22; Taunton, 59; Russell, 8; other types known as steel plows, 74. Tractors: Holt, 3; Cletrac, 1. Snow removers (Bradley) horse-drawn, 18.

This is in addition to various road machines and plows designed to be hauled by the tractors, dump cars, sleds, heavy steel brushes attached to the trucks of the elevated cars to clear the third rail from sleet, etc.

TEAMS USE THE RAILWAY RIGHT-OF-WAY BECAUSE IT IS CLEAR OF SNOW

All snow work comes under the general direction of the general manager and superintendent of transportation, and the co-operation of the municipal authorities of all towns and cities

Dumping Sleds and Dumping Cars for Hauling Snow in Boston

through which the elevated operates is solicited and obtained.

In the late summer of each year the company, through its superintendent of transportation, posts a notice in the carhouses that applications for snow work will be received from the trainmen and by Oct. 1 usually sufficient applications have been received so that the organization can be completed. Besides the rapid transit or elevated division there are four operating divisions of the company to include the surface lines, and the division superintendent of each surface division is responsible for the work of plowing and carting away the snow on his division. This means that he must (1) arrange to get the necessary dumps, (2) see that the snow-fighting equipment is in proper repair, has been tested on the street and is in readiness to put into use, (3) make out a list of the different snow routes and have it posted in the lobbies of the carhouses, and (4) be sure that the men applying for snow work are familiar with these routes. Under the division superintendents, either the station masters at the different carhouses or some duly appointed snow foremen are in charge of the snow work for the districts for which their stations are headquarters. These men see that snow foremen are appointed to follow up the work on streets. A certain number of blue uniformed men are also appointed to act as foremen, timekeepers and paymasters for the shovelers. A considerable part of this latter help is made up of regular maintenance of way men, supplemented, where that supply is insufficient, by outside labor.

Arrangements have also to be made by the division superintendent for sufficient dumping places for the snow. Docks and bridges are secured for this purpose whenever available. Permits to use sewer manholes are also obtained. Open areas, either owned by the municipalities through which the lines of the company run or by private individuals and corporations, are made available. Full details as to all arrangements of this kind made are filed by each division superintendent with the superintendent of transportation, together with a list of the men who have been accepted for snow duty with their residence and telephones, if any.

Two of the accompanying illustrations show a tractor at work breaking up a layer of ice or hardened snow at the side of the track. In one case a road machine is being used and in the other an ordinary hand plow. The former is considered preferable, and in the truck used in Boston the tongue of the road wagon is so arranged that it does not have to be hauled directly after the tractor, but will run at some distance to one side or the other if that should be desired. Another view shows one of the horse-drawn dumping sleds and another a train of dumping cars being loaded by hand. These cars are usually run in trains of not more than

Tractor Clearing Packed Snow by Using Plow

A Heavy Drift in a Boston Suburb

three cars each, the reason being that the dumps are arranged for three cars as a maximum number.

The two other views illustrate some of the difficulties of winter operation in Boston. The lower view at the right on page 912 was taken after a snowstorm in 1920 on one of the outlying lines of the company. The one at the bottom of page 911 illustrates what trucks and automobiles do in Boston after a heavy snowstorm where the company has cleared its right of way, but the rest of the street is still covered with snow. A fact which makes this picture even more notable is that the tracks at this point are not laid in the street but on a reservation in the center of the street, with no paving between the rails. The result is that after a day or two of this use of the reservation by heavy trucks the company finds most of its tie rods broken and other damage done to its right-of-way.

Improved Underfeed Stokers for P.R.T. Boiler Plant

Forced Draft Substituted for Natural Draft Under Twelve Boilers of the Company's Principal Peak-Load and Reserve Power Station—Steam-Operated Dump Plate a Feature

THE Philadelphia Rapid Transit Company in part generates the electrical power needed for its lines, purchasing the remainder from the Philadelphia Electric Company. Two-thirds of the power requirements are purchased in off-peak hours and one-third in the peak-load period. Several power plants, fairly well distributed over the city, are operated, the most modern of which is located on the Delaware River somewhat more than a mile north of Market Street. This station contains five steam turbines, one Westinghouse of 15,800-kw. capacity, two Westinghouse of 9,500-kw. capacity each, one Westinghouse of 6,000-kw. capacity and one General Electric of 2,000-kw. capacity.

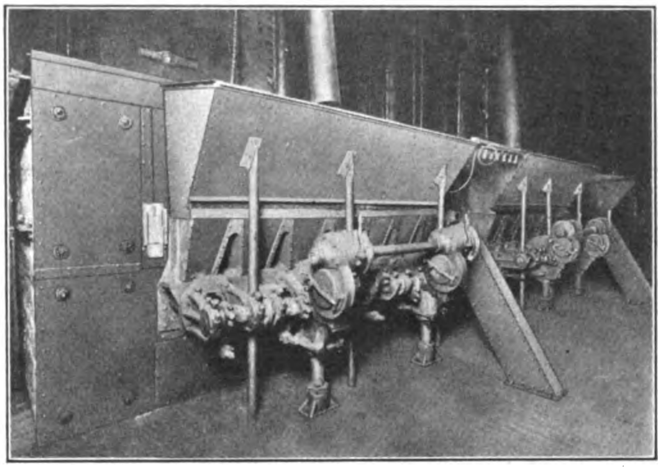
Coal is received at the plant by rail and water, being dumped into hoppers, from which it is delivered to bunkers by means of bucket type elevators and flight conveyors made by the Webster Manufacturing Company. Ashes are removed from the boilers to hoppers in a basement beneath, whence they drop into cars from which they are taken by means of a Morse & Williams dumping bucket elevator to an elevated ash bin. From this they go into electrically operated ash cars.

In studying the general power system of the company, the engineers some time ago decided that money could profitably be invested in changing over some of the boilers in this plant for forced-draft combustion. The boiler room contains sixteen 800-hp. Parker boilers and twelve Babcock & Wilcox boilers, all formerly equipped for natural draft.

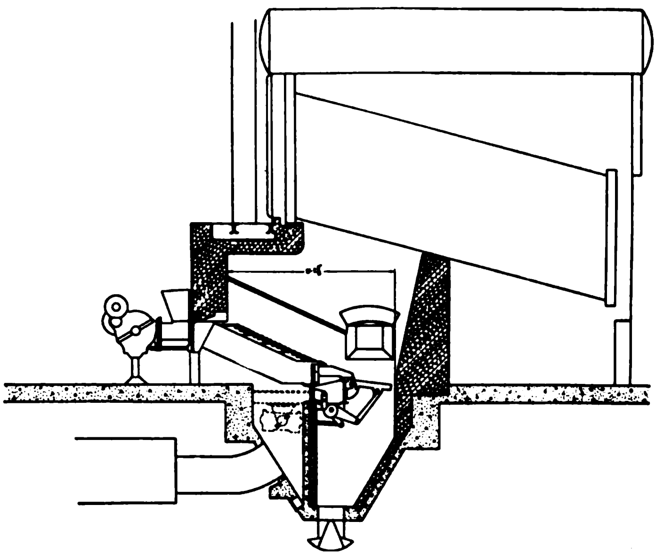
It was decided to change the stoker equipment of the twelve B. & W. boilers from the Roney overfeed type to the Taylor underfeed type. These boilers are of the marine type, six rated at 627 hp., four at 680 hp., and two at 450 hp. The Taylor stokers are of the new seventeen-tuyere, "H" type and are guaranteed to burn sufficient coal to develop 250 per cent of boiler rating continuously, and 300 per cent of rating for two hours. One hundred and thirteen square feet of stoker grate area is installed under each of the ten larger boilers and 81 sq.ft. under the two smaller boilers.

While this type of Taylor stoker is no departure in basic principles of operation from the well-known Taylor stoker, it has many improvements. Features of the fuel-feeding mechanism and air supply make possible exceptionally high fuel-burning rates per unit of stoker grate area. Advantage of the possibilities of this design was taken materially to increase the furnace volume by setting the stoker low in relation to the floor line without sacrificing operating accessibility. A furnace depth of 9 ft. 2 in. was obtained, with little change in existing ashpit construction, by using a short arch.

Among the novel features of this stoker is the use of a spur-gear power box, said to give a much higher power transmission efficiency than the worm-gear box in general use on underfeed stokers. A 50 per cent variation in the ratio between driving-shaft speed and crankshaft speed is obtained without shifting of gears or the use of clutches. All driving shafts are completely guarded. Hoppers are designed to eliminate arching of wet coal. A special feature of this design is the ease of renewing all parts subject to replacement with the minimum loss of material in so doing. A reciprocating extension grate for burning the fixed carbon from the ash is provided. The stoker is equipped with a steam-operated dump plate giving maximum free discharge opening when the plate is dropped. The plate swings above the horizontal by steam power to free the bridge wall from clinker adhesions. A cross-section of the installation is shown in the accompanying line cut and the reproduction of a photograph shows the front of the boilers and stokers.



THESE STOKERS HAVE NEW TYPE OF POWER BOX. OPERATING MECHANISM IS LARGELY WITHIN THE BOILER SETTING



CROSS-SECTION OF BOILER SETTING, WITH NEW UNDERFEED STOKER, IN DELAWARE AVENUE POWER PLANT OF PHILADELPHIA RAPID TRANSIT COMPANY

Letters to the Editors

Discussion on Depreciation

BALTIMORE, MD., Dec. 5, 1922.

To the Editors:

I have looked over with much interest your report of the Detroit meeting of the National Association of Railway and Utilities Commissioners, published in the *Journal* of Nov. 25, page 851, and desire to call your attention to one point with regard to the discussion on depreciation.

I am inclined to think that any one reading this report would infer that the sense of the meeting was in favor of the setting up of a straight reserve based upon cost less scrap and accurate life tables.

This ignores the very important statement made by Mr. Jackson and received with apparent approval by the delegates, in which he called attention to the fact that on account of the equalization of renewals the accumulation of a depreciation reserve on the method outlined above resulted in building up an enormous fund for which the utility would at no time during its future life find a legitimate use.

This fact, while it has been recognized for some time by a number of the more careful students of depreciation theories, has not, so far as I know, been publicly emphasized, and Mr. Jackson's statement was to me one of the most important ones made during the entire convention. W. H. MALTBIE.

Every Street Intersecting an Electric Railway Is a Grade Crossing

BOSTON ELEVATED RAILWAY,
BOSTON, MASS., Dec. 4, 1922.

To the Editors:

The editorial on the vehicle situation which appeared in the issue of the *Electric Railway Journal* for Dec. 2 was read with much interest. The tremendous increase from year to year in numbers of vehicles on the highways and the result to street railways of a proportionate increase in vehicle collisions should direct the attention of all concerned to trying to reduce in some manner the numer of these accidents.

A few weeks ago the Massachusetts Safety Council made a study of vehicle collisions that had occurred on Massachusetts street railways during the first eight months of the present year and came to the following conclusions:

1. Collisions with automobiles coming out of side streets without warning, or at improper speed, constitute the most serious group.
2. Automobiles turning out from the curb without signaling constitute another large but less serious group.
3. Turning in front of a car, or cutting in in front of it, is a frequent cause of serious collisions.
4. On suburban or interurban lines, where trolley cars operate at a relatively high speed, automobiles stop on the track or too close to it, and resulting collisions almost always involve serious personal injury.

The publication of this report caused an interesting editorial discussion which accomplished something toward informing the public as to the nature of this hazard. I believe that it is our duty to present these facts again and again to motorists in every state until their significance is driven home.

That the seriousness of the situation extends beyond the confines of the cities is indicated by the fact that the steam railroads of the country have this year conducted a campaign to reduce collisions with automobiles occurring at grade crossings. Our investigations on this railway have shown that automobiles and trucks coming out of side streets without warning and at high speed produce our greatest and most serious class of vehicle collisions.

Practically every side street entering a highway on which we operate street cars establishes a grade crossing over our tracks. The absolute disregard of the average driver of a motor vehicle in approaching these tracks from side streets, together with his high speed and disregard of the use of his warning signal, constitutes, in my judgment, a greater element of danger than exists at steam railroad grade crossings. This is due to the greater frequency of our cars and the greater frequency of these side street crossings. Our task is to educate the driving public to an understanding of this fact.

According to the morning press reports, in the matter of vehicle accidents and particularly in that of cross-street vehicle accidents, the street railways are up against a world-wide problem.

In a statement to the press, President Harding declares that he believes that the world in general, and the United States in particular, is finding it difficult to adjust itself to the automobile age. He thinks that this country is moving at an automobile pace and generally needs a policy of caution at the crossroads and the turnings of its future. H. B. POTTER,

Chairman Committee on Accident Prevention,
American Electric Railway Association.

Through the Gotthard Tunnel in Comfort

IN A REPORT to the Department of Commerce, Consul-General James J. Murphy declares that, in the light of experience with electrification up to the present time, the electrification of the Gotthard line, through the tunnel connecting Italy and Switzerland, may from a technical point of view be considered as entirely successful. The movement of trains is just as regular as with steam locomotives; the passengers and the railroad personnel appreciate highly the elimination of smoke; and there is no doubt that this is an important step forward, hygienically. Strain on the rolling stock is lessened and wear on the removable parts has been found to be considerably reduced. Experience shows, on the other hand, that the greater speed obtained apparently causes a more rapid wear of the outer rails on the curves. With the greater speed attained it has been possible to make improvements in the time-tables. The efficiency of the crews engaged in maintaining tracks and tunnels has increased noticeably.

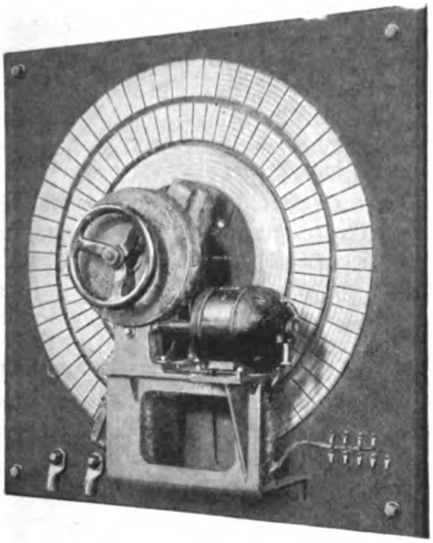
South African Railways Power Plant

AFTER numerous surveys Colenso has been chosen by the South African Railways as the best site for the new power plant which will generate the power for the electrification of the railway line. For this the locomotives have already been ordered. Colenso is about midway between the two termini of the Glencoe and Maritzburg-Colenso electrified section. Colenso will therefore probably be an important power center.

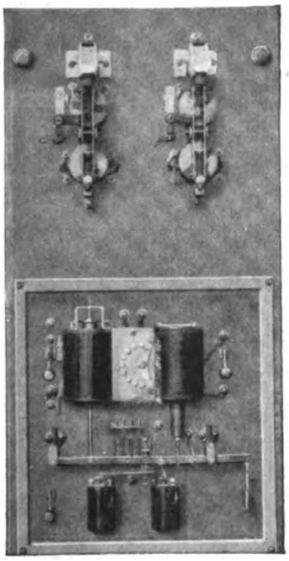
What's New from the Manufacturers

New Voltage Generator of Rheostatic Type

THE Westinghouse Electric & Manufacturing Company has installed in a number of recent power plants a type of voltage regulator differing fundamentally from the vibrating type, or "Tirrill" regulator. The new regulator maintains a constant alternating-current voltage by means of the generator field rheostat, the exciter voltage being kept at a constant value. The new regulator is not intended to supersede the Tirrill, but rather to meet conditions to which the latter is not inherently well adapted. It is particularly applicable to installations where the time constant (or rate of response to change in voltage on the field of a generator) is slow, where exciters are of large capacity and low speed, thus having heavy field currents beyond the capacity of the vibrating regulator contacts, or for synchronous condenser application, where the excitation voltage across the field of the condenser must be lowered to a value below the residual voltage of the exciter, as is very often the case.



FACE PLATE OF FIELD RHEOSTAT, OPERATED BY HIGH-SPEED MOTOR



CONTROL ELEMENT AND REVERSING CONTACTORS

The regulator equipment comprises the following: (1) A control element mounted in a glass case, and located either on a panel of the main switchboard, or on a bracket or a pedestal. (2) A pair of reversing contactor switches actuated from the main contacts of the control element. The reversing switches are for operating the rheostat motors in one direction or the other, and may be mounted on the same panel with the control element or on a separate base in the rear of the switchboard. (3) A special generator field rheostat, operating at a high rate of speed. The motor of the rheostat is quickly brought to rest by so connecting the reversing switches as to employ dynamic braking the moment the control element ceases to cause a change in the excitation current.

The control element consists essentially of a set of contacts jointly actuated by an alternating current and a direct current coil. These contacts control the direction of rotation of the rheostat motor through two reversing contactor switches. The alternating-current coil is connected to the generator lead through the use of a suitable potential transformer. The direct-current coil is connected across the terminals of the generator field. A current coil is also provided together with a suitable number of taps for compensation purposes.

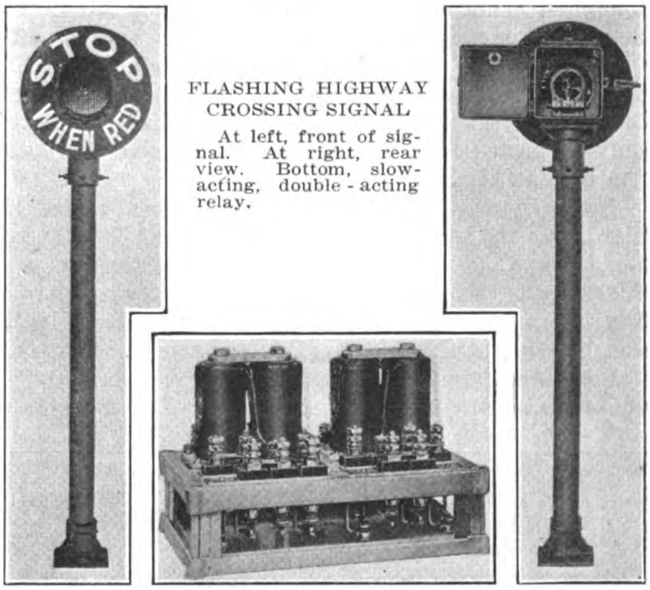
Anti-hunting features, incorporated in the design, consist of auxiliary contacts on the reversing switches which automatically change the strength of the current in the alternating-current coil at the moment there is a change in excitation voltage on the machine.

The operation of the rheostatic regulator is exactly the same as if the station operator were regulating the voltage by hand. When the line voltage is at the correct value, the regulator is in equilibrium, and consequently there are no moving parts. Should the voltage deviate from the correct value, the regulator will operate the generator rheostat to bring the voltage back to normal.

The regulator is either put in or out of service by means of a single-drum control switch.

Flashing Light Highway Crossing Signal

THE General Railway Signal Company, Rochester, N. Y., has developed a flashing-light highway crossing signal which is simple, dependable and which requires little maintenance. A special lens is used to spread an intense flashing red light which is clearly visible under adverse sunlight conditions at all distances up to 1,500 ft. The lens is protected from mechanical injury by a wire mesh guard. A double filament lamp is so placed that the effective light from both filaments is in the focal center of the lens, thereby giving the maximum intensity of light for the combined wattage of both filaments. The lamp and lamp receptacles are so made that no adjustment for focus is necessary in changing lamps. The two filaments of the double filament lamp are so made that they will not burn out simultaneously.



FLASHING HIGHWAY CROSSING SIGNAL

At left, front of signal. At right, rear view. Bottom, slow-acting, double-acting relay.

Thirty flashes per minute are produced by the use of a simple slow-acting double relay. The relay is designed to break a current of 3 amp. continuously without injury to contacts, whereas in electric railway service, a current of less than 1 amp. is all that is required. The signal is equipped with a small clear glass on each side so that its operation may be checked from the track. Provision is made for easy alignment with the highway, a sighting device being included in each signal for convenience in making this adjustment. The light unit is mounted on top of a 4-in. pipe mast or by the use of a bracket it may be mounted on an existing pole. Backgrounds are furnished lettered as shown in the illustration or as specified by the railroad.

Electric Railway Publicity

Uses Track Construction to Emphasize Interest in City

CONSTRUCTIVE advertising of a new and distinctive type is being done by the Tri-City Railway, Davenport, Iowa. It is calling attention to its municipal improvement work in the laying of 4,200 ft. of double tracking and offering for sale the 7 per cent prior preferred stock of the United Light & Railways Company, its financing corporation.

The company has erected signs between the tracks along the mile of double tracking in the central district. These signs are heavy canvas between steel pole uprights. They call attention to the $77,000 of improvement, and emphasize the fact that of this amount $23,000 will be paid out to labor. The sign states that the Tri-City Railway is undertaking this big improvement because it believes in the city and realizes that it is only by such improvements that it can give the public the best service.

In addition to this general or institutional appeal the sign gives the interesting information that 363,000 paving brick, 7,000 tons of excavation, 1,300 tons of sand, 6,900 sacks of cement, 4,200 creosoted oak ties, and 260 tons of rail and fastenings are to be used in the construction of this loop surface car artery.

Past these signs runs the steam shovel employed by the company in its excavation work. On the side of this shovel, in plain view of the thousands of spectators who watch it at work daily, is this advertisement: "Buy United Light & Railways 7 per Cent Prior Preferred Stock and Keep This Shovel Moving."

Proverbs XII-19

THE Philadelphia Rapid Transit Company was recently beset with an agitation on the part of the local newspapers to do away with the skip-stop plan of operation. The newspapers had carried the agitation to extremes and were taking every possible opportunity to reflect discredit on the skip stop. Whenever an accident occurred, for example, some such headline as this was likely to appear: "Another Murder Caused by Skip Stop." At the peak of the agitation, every car on the system appeared one morning with a dash poster which had on it only the Bible reference in large letters: "Proverbs XII-19."

The Bible verse reads as follows:

> "The lip of truth shall be established forever:
> but a lying tongue is but for a moment."

The effect was almost electrical. By noon probably 2,000,000 people, a far greater audience than any newspaper reached, had noticed and renoticed this peculiar dash sign and curiosity did the rest. One of the local Bible Institute offices was besieged with telephone calls inquiring about the reference.

The message of the poster was unassailable, and it politely told the newspapers what they were doing without calling them what they were. They apparently got the point, for it is said that the agitation was suddenly and completely dropped.

Louisville Railway Wants Representatives in City's Associations

THE Louisville (Ky.) Railway is placing men in the various clubs, business organizations and associations. This means that when any railway subject comes up for discussion in any one of these associations the representative of the railway who is a member should be able to place the case of the company properly before its members. Officials and department managers of the railway are now active in a large number of local organizations, which of course is resulting in more friends for the company, and good will is the one thing the company needs.

THIS NEW TRACK
FROM IOWA TO WARREN STREETS
363,000 PAVING BRICK
7000 TONS OF EXCAVATION
1300 TONS OF SAND
6900 SACKS OF CEMENT
4200 CREOSOTED TIES
260 TONS RAIL AND FASTENINGS
IT WILL COST $77,000 OF WHICH $23,000 ALONE WILL GO FOR LABOR.
THE TRI-CITY RAILWAY COMPANY HAS BORROWED THIS LARGE SUM FROM THE UNITED LIGHT & RAILWAYS COMPANY BECAUSE IT BELIEVES IN DAVENPORT AND REALIZES THAT ONLY BY SUCH IMPROVEMENTS CAN IT GIVE THE PUBLIC THE BEST SERVICE.
TRI CITY RAILWAY COMPANY OF IOWA

AT LEFT, STEAM SHOVEL SPREADS THE MESSAGE OF 7 PER CENT PRIOR PREFERRED STOCK. AT RIGHT, TRI-CITY RAILWAY OF IOWA BUILDS GOOD WILL AND A TRACK SIMULTANEOUSLY

Samuel Riddle, vice-president Louisville Railway, was recently elected a director of the Board of Trade.

Before the election, President Barnes sent a letter to every member of the Board of Trade calling attention to the nomination of Mr. Riddle. He explained that as a member of the directorate he would be in better position to understand the problems of the community.

Stop Guide for Electric Railway Cars

THE Metropolitan Electric Tramway, Ltd., of London, England, is trying out a car road guide in one of its tramway cars. The indicator is manufactured by the Road Guides, Ltd., London, and is a box arrangement of approximately 36 in. x 14 in. This contains a chart of the route being traveled by the car. Midway along the glass dial is a pointer which indicates to the passenger the exact position of the car at all times. As the car moves along the chart unwinds itself from one spool to another. The moving chart has printed on it all the features of the journey, such as streets, compulsory stops, museums, places of business, etc. The top portion of the chart is used for advertising to announce current events and interesting news.

Two indicators are used on each car, one on either side, so placed that the passengers can see them quite comfortably. The indicator is automatic and requires no adjustment except when the car diverges from a given route or when going in or out of service. It can be neutralized by moving a lever and can be set to any point on the route by turning another small hand lever. It is driven through reduction gears from a friction wheel which operates on the rim of one of the car wheels. Provision is made for changing the chart in a convenient manner.

Mr. Mitten to Stand Four-Square

THE familiar phrase, "Mitten Men and Management," is hereafter to include owners and public. The owners were recently added to this working combination, and the Philadelphia (Pa.) Rapid Transit Company is now out to win the public. What the company wants is intelligent interest on the part of the public. This it will attempt to gain by inviting suggestions from car riders as to improvements in service and methods. Suggestion cards will be carried by conductors, who are to write down criticisms or suggestions of the riders. In announcing the new plan, the following statement was made:

> The men and management for eleven years have been proving the value of working together. The stockholders by their recent vote and since by the use of suggestion cards, have come splendidly into line, thus completing three sides of the square which is emblematic of street railway perfection.
>
> Viewing our joint accomplishments, is it too much to hope that there may also be developed a spirit of public co-operation which shall complete the entire square—men, management, owners, public?
>
> To this end conductors should use their suggestion cards to report not only their own suggestions, which are the fruit of their observations and first-hand knowledge, but also those of their passengers, which are from the standpoint of those we are here to serve.
>
> We have been keeping our eyes open to improvements to service with splendid results. Let's keep our ears open, that we may also have the advice of our car riders.

Transformer and Busbar Standards Adopted by Electric Power Club

THE Electric Power Club, the headquarters of which are located in the Kirby Building, Cleveland, Ohio, held its regular fall meeting at Grove Park Inn, Asheville, N. C., recently.

Of the proceedings of particular interest in the electric railway field the following are the most important:

Requirements for high-potential test guarantees applying to transformers having single-voltage ratings from 550 to 50,000 inclusive were adopted as follows: High-voltage winding to low voltage winding and core, maximum high voltage rating from 550 to 4,500 volts, 10,000; above 4,500 to 50,000 volts, twice the highest rated voltage of the high-voltage winding, plus 1,000 volts; above 50,000 volts twice the normal voltage of the circuit to which the low-voltage winding is connected, plus 1,000 volts.

Busbar Ratings

The club made some revisions of its rules on application and rating of busbars and connection bars. The standard now specifies that busbars shall be rated on a basis of temperature rise instead of current density, and curves are given to cover the current-carrying capacities of the usual sizes of copper buses. These show the reduction in permissible amperes per square inch with increase of number of laminations and with increased width of bar. The capacity of alternating current is, of course, much lower than that for direct current, on account of the "skin effect," etc. A contact pressure of 250 lb. per square inch is prescribed as a minimum in bolted or clamped connections, and all contact surfaces and connections are to be cleaned by sandpapering or other suitable means immediately before bolting. The maximum temperature for proper buses is specified at 70 deg. C. in general, or 80 deg. under specified exceptional conditions.

In addition to the above, standard voltage ratings of oil circuit breakers, together with standard interrupting capacities, were adopted. Up to 73,000 volts oil circuit breakers and other switching equipment are to have ratings based on maximum values as follows: 750, 2,500, 4,500, 7,500, 15,000, 25,000, 37,000, 50,000 and 73,000. Above 73,000 volts, the standard voltage ratings corresponding to standard normal system voltages are specified as follows: 88,000, 110,000, 132,000, 154,000 and 220,000.

The standard interrupting capacities for oil circuit breakers are specified as follows, the arc amperes and the rated voltage being given respectively in all cases: 3,200 amp., 4,500 volts; 2,500 amp., 7,500 volts; 2,000 amp., 15,000 volts; 3,000 amp., 15,000 volts; 4,500 amp., 15,000 volts; 7,000 amp., 15,000 volts; 10,000 amp., 15,000 volts; 14,000 amp., 15,000 volts; 20,000 amp., 15,000 volts; 30,000 amp., 15,000 volts; 40,000 amp., 15,000 volts; 60,000 amp., 15,000 volts.

A number of definitions covering standard nomenclature for oil circuit breakers were also adopted. These will greatly assist in furthering clarity in specifications.

Management and Administration Experts Meet

A MEETING of the Taylor Society was held in New York City, Nov. 22-24, beginning with an informal dinner and the annual business meeting.

Each of six public discussions was devoted to a particular topic, covered principally by presentation of cases. The topics were: The Organization and Management of a Medium-Sized Plant; Statistical Compilation—Some of Its Uses as a Function of Scientific Management; Shaping Your Management to Meet Developing Industrial Conditions; Master Budget of Sales and Production; Reduction of Waste Through Research Studies in the Operating Department of Retail Stores; Supervision of Personnel.

Arkansas Association Meets

THE Arkansas Association of Public Utilities held its fifteenth annual meeting at Hot Springs National Park on Nov. 9. Seventy-five registered members of the association attended. A feature of the meeting was an address by Ex-Governor Charles H. Brough on the development of the state. The convention was also addressed, among others, by E. F. Wickwire, Mansfield, Ohio. It was voted to hold the 1923 meeting at Pine Bluff. The following officers were elected: President, S. A. Lane, general manager Bell Telephone Company of Arkansas, Little Rock; first vice-president, J. L. Lorgino, Pine Bluff; second vice-president, Arthur E. Main, Mammoth Springs; secretary-treasurer, R. L. Brown, Little Rock, who was re-elected.

Kentucky Association Meets on Dec. 12

AS PREVIOUSLY announced in this paper, the Kentucky Association of Public Utilities will meet in Lexington on Dec. 12. The program includes a number of addresses on public relations and allied topics, beginning with an address by President L. B. Herrington, vice-president Kentucky Utilities Company, Louisville. In the list of speakers are the names of James P. Barnes, president Louisville Railway; Samuel Insull, president Commonwealth Edison Company, Chicago; Dean F. Paul Anderson, University of Kentucky, and C. N. Manning, president Security Trust Company, Lexington. The sessions will be held at the Phoenix Hotel and the University of Kentucky, and will probably be well attended, judging by the interest that was shown last year.

Pacific Railway Club Admits Manufacturers

AT ITS November, 1922, meeting the Pacific Railway Club adopted the recommendation of its board of governors and amended the club's constitution to admit supply men. This is done under the classification "Associate Membership," which includes persons not eligible for active membership but who are actively engaged in occupations where they co-operate with men in railroad service for the advancement of the science of railroading and the best interests of the railroad profession. Associate members will have all privileges except those of voting and holding office, and their dues are $3 per year.

American Association News

Dinner Committee Meets

THE first meeting of the mid-year conference special dinner committee was held in the office of the chairman, J. H. Hanna, in Washington, D. C., on Dec. 6. The general preliminaries were gone over. It was decided to hold the meeting and banquet at the Willard Hotel on Friday, Feb. 16, where there is available a meeting room which will seat 500 and a fine new banquet hall which will provide for 800. The price of the dinner tickets was set at $10, and tentative plans for music, entertainment, decorations and a separate dinner party for the ladies were agreed upon.

Those present were Chairman Hanna, Secretary J. W. Welsh, H. B. Flowers, C. C. Peirce, W. F. Ham, Harry L. Brown and J. N. Shannahan, chairman of the meetings and subjects committee, which has general charge of the mid-year conference.

Advertising to the Automobile Owner

THE advertising section of the American Electric Railway Association has just gotten out fifteen publicity cards for use in newspapers and directed at the automobile owner. The text of each is that he would do much better to store his car in the garage until next April and depend on the electric car for his transportation.

The cards are of uniform size, 2 in. x 6 in., or suitable to use in a daily newspaper column, and the association is prepared to furnish mats for these cuts without charge to member companies. The drawings are designed so that it is possible to mortise out room enough at the bottom of most of them for the company's name, if desired. It is suggested, however, that the "ads" had better be run without signature. A few of these are reproduced.

Pamphlets Issued

THE American Electric Railway Association has recently sent to member companies five printed addresses or reports in pamphlet form. One is the address of President Jackson at the annual convention of National Association of Railway and Utilities Commissioners in Detroit, Nov. 14. The second is the report of the committee on motor vehicle transportation, presented at the same convention. Two others are papers or reports presented at the recent Chicago convention; one the report of the committee on uniform motor vehicle regulation, the other the paper on the preparation and administration of a budget, read before the Accountants' Association by Harry A. Snow. The fifth pamphlet is a reprint of an address on the responsibility for the cost of paving read by A. T. Davison, Third Avenue Railway System, before the Engineers' Club of Philadelphia. This reprint is distributed with the compliments of the Third Avenue Railway.

Distribution of 1922 "Proceedings"

IT IS expected that the 1922 *Proceedings* will be available for distribution on or about Jan. 1, covering the American and the four affiliated associations. In view of the fact, however, that the manufacturer members, as a rule, do not care to receive the *Proceedings* of the Accountants, the Claims and the Transportation & Traffic Associations, only the American and Engineering Association *Proceedings* will be sent them unless they specifically request the others. Railway members will receive one copy of the *Proceedings* of each association and individual members will receive copies of the *Proceedings* of the association with which they are respectively affiliated.

Arrests and Convictions in Buffalo —No Results from Fare Conference

Ernest J. Jaggard, president of the Buffalo Jitney Owners' Association, charged with conspiring with officials of the Manhattan Transit Company of New York to evade the transportation corporation law in the operation of jitneys in Buffalo, was found guilty by a jury in City Court and was fined $100. After the conviction he resigned from the organization. Joseph H. Hoadley of New York, president of the Manhattan Company, was discharged in City Court following a trial on a charge of conspiracy growing out of the same case. The prosecution failed to show any criminal intent. Henry D. Chapin of New York, vice-president of the Selden Motor Truck Company, Rochester, and the company's New York manager, also was discharged after trial on a conspiracy charge. It was not proved that Chapin was an official of the Manhattan Transit Company.

The trial and conviction of Jaggard is the result of evidence obtained by the International Railway, Buffalo, in connection with its intensive campaign to rid the city of jitneys which are running in defiance of court injunctions and the state law. It is estimated by officials of the International in charge of the jitney service investigation that close to 2,500 jitneys are operating daily over scheduled routes in the city of Buffalo. Many officials of the claims department of the Philadelphia Rapid Transit Company, Philadelphia, have been detailed to the work of getting evidence and checking jitney drivers throughout the city. Arrests are being made daily but nominal fines are being imposed by the City Court judges. Few are getting penitentiary sentences, except in contempt of court cases and the evidence in these cases is exceptionally difficult to obtain.

The police guard has been withdrawn from all local and interurban cars on the lines of the International Railway with the exception of the "owl cars" on the local lines in Buffalo. Police authorities stated that the emergency now has passed and there is no more danger of rioting although loyal employees of the company are being assaulted, dragged off their cars and stripped of their clothing every few days. Cars also are being stoned in outlying sections of the city.

As a result of a conference held in the Mayor's office it was disclosed that the law covering public utilities prohibits a charge for transfers. The Mayor had proposed to the International the restoration of the 5-cent fare and a 1-cent transfer. Among those who attended the conference on behalf of the International were Thomas E. Mitten of Philadelphia, chairman of the board of the International; Herbert G. Tulley, president, and Edgar J. Dickson, vice-president in charge of operation. Mr. Mitten promised to present a new plan on or before Jan. 10.

The conference was the second of a series between three members of the City Council and three representatives of the International. It was productive of no results although it continued almost all day. Officials of the International were asked by the Mayor to drop the prosecution of jitney drivers but this was flatly rejected. The conference was behind closed doors. The Socialist member of the City Council is making a fight to have the negotiations in the open.

Resolution Adopted for Investigation of Return to Five-Cent Fare

Crops have started to mature from the seed sown at the election in November, so far as the Schenectady situation is concerned. With Mayor George R. Lunn of Schenectady, elected Lieutenant-Governor on the Democratic ticket, having decided to continue to hold the office of Mayor also, the Common Council of Schenectady on Dec. 4 passed a resolution without a dissenting vote to make a searching investigation of the feasibility of abolishing the 7-cent fare granted by the Public Service Commission and restoring the 5-cent limit contained in franchises under which the railway lines are operated.

The resolution was presented by Alderman Frank X. Shay, president pro-tem. He preceded presentation of the resolution with a brief review of the Council investigations and of legislation in May, 1920, at the time Edward M. Bemis was employed by the city to investigate the advisability of allowing the company an increase in fare from 6 to 7 cents to permit it pay increased wages.

The resolution provides for an immediate investigation by the Council and will include, in addition to the fare question, inquiry into the safety and convenience of one-man cars and the adequacy of the service.

"The great probability of legislative action soon after Jan. 1, restoring power to the Common Council and the city authorities to compel compliance with franchise provisions," is the reason given in the resolution for the immediate action.

Thus time is apparently being seized by the forelock, for in the event that the public service commission law is amended to confer regulatory power upon municipalities, Schenectady will be ready and waiting so far as street railway regulation is concerned.

Arbitrators for Rental Issue Named

An arbitration board has been named to decide the rate of rentals to be paid to the city of Detroit by the Detroit (Mich.) United Railway for the use of the city-owned tracks by the corporation's interurban cars. The arbitration proceedings will be confined to the question of rentals alone and will not include the several points which the Detroit United Railway officials had desired arbitrated.

Professor Henry E. Riggs of the University of Michigan has been named by the Detroit United Railway as its representative; H. M. Gould, electrical engineer of the Department of Street Railways, will represent the city and William E. Davis of Cleveland, Ohio, has been agreed upon by the first named arbitrators as the third man to complete the board.

Elliott G. Stevenson, president of the Detroit United Railway, had announced that the company would contend that the same board of arbitrators should decide a number of other questions, including the matter of the amount the city should pay to the company for a quantity of miscellaneous equipment taken over by the city on May 15, last, when the city purchased the company's lines and equipment.

Another point which the company contended should be settled at the same time concerned the differences over the day-to-day agreement under which the city operated cars over certain of the company's lines prior to May 15.

Investigation to Be Resumed

Mayor George P. Carrel's Street Railroad Committee of Cincinnati, Ohio, will resume its investigation into the affairs of the Cincinnati Traction Company and its affiliated corporations, while awaiting a definite report from the conference committee of the traction company and the Cincinnati Street Railway on negotiations between them for a financial reorganization of the former company.

This point was one decided upon by the Mayor's committee on Dec. 1, after representatives of the two companies, meeting with the Mayor and his committee, had asked for further time. The hearings of the Mayor's committee will be resumed on Monday, Dec. 11.

Walter A. Draper, vice-president of the Cincinnati Traction Company, expressing himself at the meeting, said he felt confident it would be possible to inform the committee definitely "before the end of this year" whether an agreement between the two companies is possible.

Boston Must Pay Traction Deficit

United States Supreme Court Rules City Is Liable for Assessment to Meet Costs of Public Operation—City Contended $2,000,000 Depreciation and $2,000,000 Maintenance Charges Were Excessive

THE taxpayers of Boston must pay the $4,000,000 deficit from the 1919 operation of the Boston Elevated Railway, including the city-owned subways and other traction properties. This in effect is the ruling of the United States Supreme Court in the case decided by it on Dec. 5 against the city in its suit against State Treasurer James Jackson and the trustees of the railway to test the legality of an assessment under the special act of 1918 to meet the deficit. The case was up on an appeal from the Massachusetts Supreme Judicial Court, which had reversed the decision of the court below in favor of the city. The United States Supreme Court affirmed the ruling of the Massachusetts Supreme Court, the decision being handed down by Chief Justice Taft.

Chief Justice Taft, in delivering the opinion, said:

This is a writ of error to a decree of the Supreme Judicial Court of Massachusetts sustaining a demurrer to a bill in equity against the treasurer and receiver general of the Commonwealth of Massachusetts, the Boston Elevated Railway and the trustees who are operating the railway under a special statute of the Commonwealth, and dismissing the bill for want of equity, the defendants not wishing to plead further. It now comes before us on a motion by the Attorney General of Massachusetts to dismiss or affirm.

The case as made by the bill is an impeachment of the validity of the special act of 1918. By acts of 1902 and 1911 the city of Boston was given power to construct and did construct subways and tunnels at a cost of $31,000,000 and by the same authorities leased these and also others built by it under earlier statutes to the Boston Elevated Railway for a fixed rental until July 1, 1936, and the whole property and its rents and profits are by the express terms of the statute held by the city, "in its private or proprietary capacity, for its own property," never to be taken by the commonwealth except upon payment of just compensation. The railway got into financial difficulty. It served the residents of Boston and other towns of the commonwealth.

Act to Relieve the Situation

The General Court in the public interest passed the special act of 1918 to relieve the situation. In general, the act provided for the appointment of trustees who were to take the railway out of the hands of the company and operate it under the leases to the company by the city of Boston on condition that the stockholders of the railway accepted the provisions of the act.

These provide for the payment of dividends on the stock of the company, the repair and maintenance of the railway, the raising of $3,000,000 by the company for the improvement of the property and a reserve fund, and the payment of any deficit in operation out of the treasury of the commonwealth.

If the commonwealth is called upon to make payments, to meet deficits or diminution of the reserve fund, such amounts are to be assessed upon the several cities and towns in which the railway operates, as an addition to the regular state tax, in proportion to the number of persons in said cities and towns using the service of the company at the time of the payment as determined by the trustees. The trustees are to fix the fares to meet the cost of service, including taxes, rentals and interest on the indebtedness of the company, fixed dividends on the preferred stock, and 5 per cent on the common stock for two years, 5½ per cent for the next two years and 6 per cent for the remainder of public operation, which is for a period of ten years and thereafter, as the commonwealth shall determine.

Trustees Take Charge

The company's stockholders having accepted the act, the trustees took over the possession and operation of the railway. They found the railway in bad repair and charged $2,000,000 depreciation and $2,300,000 for maintenance and repair in the year 1919. This led to a deficit for that year of $4,000,000, although in previous years the company had not expended more than $100,000 a year on such account. The treasurer and receiver general under the act of 1918 paid the deficit out of the treasury of the commonwealth and was about to include the same in the state taxes to be collected by the city of Boston and the other towns through which the railway runs in the proportion fixed by the act. The object of the bill was to prevent this levy and collection and further proceedings under the act.

The motion to dismiss is urged, first, on the ground that Charles L. Burrill as treasurer and receiver general was the defendant in the original bill and that the present defendant, Jackson, his successor in office, has been substituted without legal sanction. The substitution took place in the Supreme Judicial Court of Massachusetts before that court considered the case on its merits and in the court's opinion the objection to the substitution was noted and overruled. This settles conclusively so far as we are concerned that the state law authorized the substitution.

The second ground urged for dismissal is that the tax for 1919 sought to be enjoined has been collected from the taxpayers of the city by the city and paid over to the treasurer of the commonwealth so that the case here becomes a moot one. The action of the state court upon such a matter relieves us from its consideration.

What the State Did

Having disposed thus of the ground presented for dismissing the writ of error, we come to the alternative prayer for affirmance. The plaintiff in error comes to this court because, as it says, the statute of 1918 of the commonwealth, by which the trustees took over and are now operating the railways, impairs the obligation of the contract of lease of its property in the tunnels and subways to the railroad and so violate the contract clause of the federal constitution.

As to this and other contentions the opinion says: We are relieved from full detailed consideration of these grounds urged for reversal by the satisfactory opinion of the Supreme Judicial Court in this case.

What the commonwealth did was to help the people of the towns which the railway served when the railway's finances threatened its collapse, by taking over the lease of the railway for a valuable consideration. The law provided for keeping the property in good repair and the payment of the rentals due the city. There was nothing in the contract of assignment which in the slightest degree impaired the obligation of the company to the city under the lease. Indeed, it secured the performance of those obligations.

To the contention that the contract was impaired because the law took away or impaired its beneficial interest in the profits of the contract of lease and its property, the Supreme Judicial Court of Massachusetts is quoted as saying that the tax was not imposed on Boston in its proprietary capacity in which it built the subways and leased them. The taxes were collected with state taxes to achieve a state purpose and Boston in its public and political character was a mere state tax agency for collection. The taxpayers were to be called upon to bear the burden of the public purpose of the state in furnishing this important service of transportation in and between the communities in which they lived.

State May Confer

In disposing of this objection we have in effect disposed of those objections to the act of 1918 based on the fourteenth amendment. If the constitution and laws of Massachusetts authorize the commonwealth to operate a railway for the public benefit, there is nothing in the fourteenth amendment to prevent. Nor is there anything in it preventing the State from using the trustees as agents to operate the railway and in such operation to determine the needed expenditures to comply with the obligations of the lease or the requirements of adequate public service. This is delegating to proper agents the decision of a proper administrative policy in the management of a state enterprise and the ascertainment of facts peculiarly within their field of authorized action.

In this conclusion we assume, as did the Supreme Judicial Court, that the State may confer on one of its sub-divisions like a city or town the private proprietary capacity by which it may acquire contract or property rights protected by the federal constitution against subsequent impairment by its creator, the State. We do not wish to be understood as accepting such assumption as an established rule. All we do not decide is that even if the city of Boston may invoke the contract clause of the federal constitution to protect its rights under the lease as against infringing legislation by the commonwealth, the act of 1918 does not infringe.

As indicated in the Supreme Court decision the city of Boston, under legislative acts of 1902 and 1911, was given power to construct subways and tunnels at a cost of $31,000,000, and leased these and others already built to the Boston Elevated Railway for a fixed rental until July 1, 1936. The railway got into financial difficulties during the war period, and the Massachusetts General Assembly passed a special act in 1918 to relieve the situation by placing the railway properties under control of a board of five trustees, the State to pay any operation deficit, and assess it against the communities served by the railway lines.

The trustees declared a deficit of $4,000,000 for 1919, after charging up $2,000,000 for depreciation and $2,300,000 for maintenance and repair. The State paid the deficit, and was preparing to assess it against Boston and other cities served, when the city brought suit to enjoin its collection. The city contended the depreciation charge was "excessive, unreasonable, unnecessary and illegal," pointing out that the railway under private control had charged off only $98,000 a year. To be assessed with this deficit, the city claimed, was a violation of its lease to the railway.

Rejects Municipal Offer

The New Brunswick Power Company, controlling the electric light and power, electric railway and gas services in St. John, N. B., has rejected the municipal offer of $2,577,655 for its plant and equipment, according to an announcement of Mayor Fisher. This figure was set by the Supreme Court as the value of the company's property in 1920.

The power company offered four alternative propositions: To sell the property to the city on a basis to be determined by arbitration; to arbitrate the rates to be charged; to elect two members of the board of directors of the company on appointment by the city; or to sell the electric light and power department to the city, retaining the street railway and gas departments.

The company's bonds are held largely in the United States.

The New Brunswick Government approved recently a contract between the Provincial Electrical Power Commission and the city of St. John for delivery of hydro power to the city from the Musquash plant. The signature of Lieutenant-Governor Pugsley, who is visiting New York, remains to be affixed to that contract.

Charles A. Coffin Foundation Set Up

General Electric Company Creates Fund of $400,000 in Honor of Its Founder to Provide Rewards for Its Employees and for Utility Companies and Aid for Education and Research

By action of its board of directors, the General Electric Company has set aside a fund of $400,000, to be known as the "Charles A. Coffin Foundation," the income from which, amounting to approximately $20,000 per year, will be available for encouraging and rewarding service in the electrical field by the award of prizes to the company's employees and by giving recognition to lighting, power and railway companies for improvement in service to the public, fellowships to graduate students and funds for research work at technical schools and colleges.

The foundation will be controlled and administered by a foundation committee appointed by the board. This committee, within the limits of the purposes for which the foundation is created, will have power to charge the conditions applicable to the distribution of the fund and the amounts for each purpose.

HOW THE INCOME WILL BE USED

The committee proposes to distribute the income of the foundation as follows:

1. Eleven thousand dollars in prizes for the most signal contributions by employees of the General Electric Company toward the increase of its efficiency or progress in the electrical art. Particularly, the prizes are further to encourage suggestions from workmen. With each prize the company will give a certificate of award. Foreman's prizes are to be awarded for the best department, taking into account its appearance, efficiency of operation and conditions which add to the better conduct of the work and the welfare of the employees. All employees of the company, except executive officers, heads of departments, works managers, superintendents, district office managers and similar executives, are eligible for such prizes. In works where employees' representation has been adopted such representatives will co-operate with the prize committee in awarding prizes.

2. A gold medal, to be known as the Charles A. Coffin medal, will be awarded annually to the public utility operating company within the United States which during the year has made the greatest contribution toward increasing the advantages of the use of electric light and power for the convenience and well-being of the public and the benefit of the industry. The company receiving the medal will also receive $1,000 for its employees' benefit or similar fund. A committee to be named by the National Electric Light Association and known as the Charles A. Coffin prize committee of the National Electric Light Association, which shall consist of its president, the chairman of its public policy committee and a third member nominatel by them, will award this medal, acting with the advice and co-operation of a committee appointed by the foundation committee. The expenses of the committee are to be paid out of the income of the foundation.

3. A gold medal, to be known as the Charles A. Coffin medal, will be awarded annually to the electric railway company within the United States which during the year has made the greatest contribution toward increasing the advantages of electric transportation for the convenience and well-being of the public and the benefit of the industry. The company receiving the medal will also receive $1,000 for its employees' benefit or similar fund.

A committee to be named by the American Electric Railway Association and known as the Charles A. Coffin prize committee of the American Electric Railway Association, which shall consist of its president, the chairman of the committee on policy and a third member nominated by them, will award this medal, acting with the advice and co-operation of a committee appointed by the foundation committee. The expenses of the committee are to be paid out of the income of the foundation.

4. Five thousand dollars is to be awarded annually for fellowships to graduates of American colleges and technical schools who, by the character of their work and on the recommendation of the faculty of the institution where they have studied, could with advantage continue their research work either here or abroad; or some portion or all of the fund may be used to further the research work at any of the colleges or technical schools in the United States. The fields in which these fellowships and funds for research work are to be awarded are: electricity, physics and physical chemistry. A committee appointed by the foundation committee will award such fellowships and funds for research work, with the advice and co-operation of a committee of three, one to be appointed by each of the following: National Academy of Sciences, American Institute of Electrical Engineers and Society for the Promotion of Engineering Education. This committee is to be known as the Charles A. Coffin fellowship and research fund committee, and the fellowships are to be known as the Charles A. Coffin fellowships. The expenses of the committee are to be paid out of the income of the foundation.

5. In each annual report of the General Electric Company a statement will be made of the awards under the Charles A. Coffin Foundation, and other publicity will be given to such awards.

The board of directors of the General Electric Company has appointed as the Charles A. Coffin foundation committee the following officers of the company: A. W. Burchard, J. R. Lovejoy, E. W. Rice, Jr., Gerard Swope and O. D. Young.

The advisory committee of the General Electric Company will administer the fund within the organization of the General Electric Company. The following committees to administer the fund and to act with organizations outside the General Electric Company have been appointed:

Committee to co-operate with the National Electric Light Association—A. H. Jackson, vice-president; J. R. Lovejoy, vice-president.

Committee to co-operate with the American Electric Railway Association—J. G. Barry, vice-president; A. H. Jackson, vice-president.

Committee to co-operate with the National Academy of Sciences, American Institute of Electrical Engineers and the Society for the Promotion of Engineering Education—E. W. Rice, Jr., honorary chairman; A. H. Jackson, vice-president; W. R. Whitney, director of research laboratory.

Under date of Dec. 2, the president of the General Electric Company issued a letter in explanation of the Charles A. Coffin Foundation. This letter states that Mr. Coffin was the founder and creator of the General Electric Company, of which he has been the inspiration and leader for thirty years. As an expression of appreciation of Mr. Coffin's great work not only for the General Electric Company but also for the entire electrical industry, and with the desire to make this appreciation enduring and constructive, as Mr. Coffin's life and work have been, the board of directors of the General Electric Company created on his retirement and now desire to announce "the Charles A. Coffin Foundation."

Home Rule Measures in Contemplation

Tentative Legislative Program for New York State Expected to Be Agreed Upon at Conference for Which Call Has Been Issued—Program Expected to Be Put Through

As the time approaches for the New York State Legislature to convene speculation is shaping itself over the question of what may be expected to happen. The newly elected administration in New York State is Democratic in its entirety with the exception of the lower house of the Legislature. That body stands sixty-nine Democrats to eighty-one Republicans, with five of the Republican members from Greater New York who may reasonably be expected to vote with the Democrats on many matters of party policy. Besides this several up-state Republicans are pledged to radical measures.

Had the election been a close one instead of a landslide, the lower house might reasonably be expected to exercise a check on the activities of the Senate and block many of the administration measures, but political leaders of both parties are inclined to believe that in the face of 400,000 majority the lower house will hardly assume to place itself in the position of blocking legislation for which in the final analysis the Democratic administration must assume responsibility.

In the matter of public service commission legislation, measures are expected to be introduced giving to municipalities the regulation of public utilities located within their boundaries. This will probably mean that the present Public Service Commission will be permitted to continue to function as a state body, but that the part of the law will be eliminated which permits the commission to raise or lower a rate or charge regardless of the existence of any general or special law franchise or ordinance. The centralized power of the commission may also be lessened.

In the electric railway field, to cite two instances, this would mean the restoration of 5-cent fare in the city of Troy, where a local franchise exists, and a similar fare in the city of Rensselaer, where there is a special statute to that effect which has never been repealed, except by inference.

Should the change in the public service commissions law limit the regulation by municipalities to those public service corporations wholly within their bounds, little jurisdiction would be exercised by such municipalities and a corporation so serving would be able to evade local and secure state regulation by simply building a spur into outlying territory. It is reasonable therefore to suppose, if the policy of local regulation is finally agreed to, that local authorities will be given the power of regulation over public service corporations located principally within the boundaries of their localities.

Such a program means the creation of cumbersome local administrative machinery with the ultimate cost to many localities greater than the benefits which may be expected to accrue. Still it seems to be the policy of the administration to go ahead with the plan "because the people voted for it." Certain it is that during the transitory period of a change from state to local regulation a perfect hodge-podge will exist with the chance remaining that the courts will declare the entire scheme incompatible with public interests.

In the matter of labor legislation one of the first things which will be attempted is an amendment to the compensation law making insurance in the state fund exclusive except in the case of municipalities which may elect to become self-insurers. While such legislation will have the backing of the State Federation of Labor, the Lockwood committee and the administration a most bitter fight is anticipated before it is passed. The casualty and mutual companies now writing workmen's compensation insurance will insist—and not without a show of reason—that they receive an opportunity to effect a gradual withdrawal from business in order to protect their investments and it is not altogether certain that the most radical propositions in this respect will eventually become part of the law.

New Franchise Provisions in Vancouver

Existing Franchise Amended in Many Particulars—New Arrangement Provides Bus for Operation

After prolonged negotiations, a new agreement has been made between the British Columbia Electric Railway and the city of Vancouver, amounting virtually to a new franchise. It amends the existing franchise, dated 1901, in several important respects, especially in providing for the continuance of the 6-cent fare and for new motor bus routes. It further provides for a reduction in lighting rates within the city limits from 6 cents to 5 cents a kilowatt-hour.

The 6-cent fare charged in Vancouver has been the subject of negotiation and temporary measure for three and a half years. The last permit was due to expire on Dec. 15, by which time the city was to make a new agreement or the provincial government form a board of some nature to adjudicate the matter. This is not the first time recently that a new franchise has been proposed. On two former occasions the City Council failed to come to any agreement and it was believed that no agreement could be found suitable to it. To the last, some members were inclined to put the agreement to the voters, but a declaration by the company that it would withdraw its concessions deterred them.

The provincial government has announced its intention to pass an act providing for a board of arbitration to decide passenger rates of the British Columbia Electric Railway, but the new agreement with the city of Vancouver stipulates that both parties shall not apply to such a board to modify its terms.

The provisions of the new agreement briefly are these:

The 6-cent fare within the city is continued for three years, at the end of which time the fare is to be decided by agreement or, failing that, by arbitration.

The domestic lighting rate in Vancouver is to be reduced on Jan. 1, 1923, from 6 cents to 5 cents a kilowatt-hour.

Where transportation is not adequately provided, the company is to operate buses, provided reasonable roadways are available. The unique feature of this proviso is that the city is to contribute toward any deficit in the operation of such lines.

The company agrees to stand one-half the deficit on these lines up to the amount of $5,000. The remainder is to be deducted from the percentages paid to the city out of the gross annual receipts of the system. Only two lines are at present proposed, and it is likely under this arrangement that the city will scrutinize the possible traffic before ordering the company to provide service.

The company is to replace several portions of temporary track with permanent track within one year, the cost being estimated at about $100,000.

Several other clauses call for further contributions by the company for the maintenance of pavement between the car tracks. The company is required to provide granite blocks for each side of the rails, to pay to the city $5,000 for maintaining pavements and construct and maintain the sub-base between the tracks in future permanent construction.

Within the next five years the company is to spend $250,000 in placing light and power wires underground.

As the city of Vancouver is only a small portion of Greater Vancouver, with only two-thirds of the population of the greater city, this agreement affects only a part of the city system. But agreeemnts are in existence with the municpalities of South Vancouver, Point Grey and North Vancouver and the city of New Westminster which make fare permissions contemporaneous with those in the city of Vancouver. The commutation fare to the suburbs of Vancouver is 7 cents, and this will therefore remain until amended by the proposed provincial board.

Vote Against Municipally Owned Bus System

The proposition to establish a municipally owned bus system in Pasadena, Calif., a bond issue for which was voted on at an election held on Dec. 5, failed by 800 votes to gain the two-thirds majority necessary to carry. The official count was 5,555 yes and 3,930 no. The week prior to the election the Pacific Electric lines negotiated with the present operating bus lines to purchase their interests. This offer was acceptable to the bus operator.

$101,410,000 Transit Proposal

Philadelphia Mayor Presents Outline of Comprehensive High-Speed Line—Program for P. R. T. Company

A comprehensive high-speed system, involving, in addition to the Broad Street subway, two elevated roads, was outlined on Nov. 5 by Mayor Moore of Philadelphia in a letter to Thomas E. Mitten, president of the Philadelphia Rapid Transit Company. The cost of constructing and equipping the system is placed at $101,410,000.

The Mayor's letter to Mr. Mitten embodied the following links in a high-speed program:

1. The Broad Street subway proposition, subdivided into five sections, comprising a four-track subway from Christian Street to the point where the railroad tracks tunnel beneath Broad Street just south of Hunting Park Avenue, and a two-track subway from Hunting Park Avenue to Olney Avenue and from Christian Street to League Island.
2. Construction of an elevated road extending westward from Broad on Christian Street, thence over Gray's Ferry Avenue to Woodland Avenue and up Woodland Avenue to city line.
3. An elevated road from the intersection of Germantown Avenue with Broad Street, north on Germantown Avenue as far as Chelten Avenue.

The Mayor in replying to Mr. Mitten's request for specific information as to cost and probable date of completion, said he was prepared to begin work on the first section of the Broad Street subway, running from City Hall to Hunting Park Avenue, on March 1, and that if money is made available for the purpose, he would begin work at the same time on the lower four-track section, from City Hall to Christian Street.

Director Twining in a letter to the Mayor said he saw no reason why the four-track portion of the Broad Street tube, the two-track strip up to Wyoming Avenue and the three-track elevated running out Christian Street and down Woodland Avenue as far as Forty-ninth Street couldn't be finished by July 1, 1926.

The Mayor also said he thought those portions of the high-speed program could be equipped and placed in operation in 1926, while the remainder could be finished as soon as possible and tied in with the completed portions as the sections became available. Construction and equipment of the Broad Street subway from Christian Street to Wyoming Avenue, with the feeding elevated line extending as far as Forty-ninth Street and Woodland Avenue, would cost $66,920,000, and that is the estimated sum upon which the Philadelphia Rapid Transit Company would have to pay a return at the time operation was begun of the subway-elevated.

The Mayor announced he was prepared to discuss an operating lease with Mr. Mitten at once, but he evinced a determination to begin construction anyhow of the North Broad Street end of the road on March 1, 1923.

Financial and Corporate

Operating Income Increases

Eleven Months Operation in Bridgeport Shows Net Income of $119,450—No Provision for Stockholders

Results of the Connecticut Company's operation in Bridgeport from Nov. 20, 1921, to Nov. 1, 1922, show that the 5-cent fare with restricted jitney service is increasing the trolley fund and is apparently a better investment than the 10-cent rate with unrestricted jitney competition. The company is now meeting operating expenses and taxes. Figures for the eleven months operation were recently compiled by Edward Field, auditor for the commission, from the books of the Connecticut Company.

Although the company shows a gain in its operating income no provision is made for depreciation nor a return to the stockholders on the investment. When the commission fixed an appraisal of the Bridgeport division an amount of $63,700 was decided upon as a fair monthly return if the division was operated by an independent company with private stockholders. For the entire period represented in the accompanying table this would make a fair return of $724,059. As a matter of fact, it will be noted from the figures that the Bridgeport division suffered a deficit for the eleven months period of $605,618 after allowing for the return on property.

Since Nov. 20, 1921, the Bridgeport division of the Connecticut Company has been operated as a separate undertaking. At that time the commission ordered a test period of ninety days to continue until changed by the commission. The commission has not yet ordered any change.

It is noted in the figures shown that for the first two months the operating income was a deficit, but that thereafter, except in the month of October of this year, the company was able to meet expenses. The net income for the eleven months period amounted to $119,450. This profit in operation, it was brought out by the commission and the Connecticut Company, had been made with continued jitney competition and that Bridgeport was the only city in the state where jitneys were still allowed to operate independently of the Connecticut Company.

An absorption of the jitney lines by the Connecticut Company has been suggested as a solution of the transportation problem in Bridgeport under a purchase arrangement with the present owners and company operation of bus lines to supplement existing railway lines. It is said that some company officials believe that a 5-cent fare in Bridgeport would be successful from the point of view of return provided jitneys would be eliminated on parallel lines and service rearranged to cover territory now covered by both trolleys and jitneys.

Richard T. Higgins, head of the utilities board, stated that no immediate change in the Bridgeport situation was contemplated. He said that the commission had made a study of the Bridgeport case and that numerous details had occupied the attention of that body and resulted in a continuance of the trial of the radial 5-cent fare.

Protests Higher Assessment

A delegation representing the Louisville (Ky.) Railway appeared before the Board of Equalization on city tax matters at the City Hall recently and launched a protest against an increase in figures for assessment of company property. This year City Assessor E. E. Bristow placed the net franchise and property valuation of the company at a tentative figure of $18,000,000, as against $10,000,000 last year. The company holds that new improvements do not justify any such increase in assessment figures.

The company also held that with an increased assessment increased taxation would make it impossible for the company to make the profits allowed in its contract with the city, which would force an increase in fare, under the contract agreement, in course of time, as it would represent increased operating cost and prevent the barometer fund from growing.

General opinion is that final figures will not be much higher than those of last year. The Board of Equalization took the matter under advisement.

Representing the company at the conference were Attorneys Churchill Humphrey and Ed Humphrey, President James P. Barnes of the company and Auditor Frank Belleville.

Directors Ratify Sale

Rochester & Syracuse Purchases Empire Railroad Stock—Application to Go Before Commission

The control of the Empire State Railroad Corporation was recently purchased by the Rochester & Syracuse Railroad Company, Inc., after the board of directors of the latter corporation held a special meeting to ratify a contract entered into on Nov. 20 by representatives of the two railway interests.

The Rochester & Syracuse line acquired control of the Empire State by purchasing approximately 20,000 of its 29,500 shares of stock. Officers of the Rochester & Syracuse road declined to disclose the purchase price.

An application for approval of the purchase will be filed immediately with the Public Service Commission at Albany, and the sanction of that body is expected by the first of the year, due to the benefits both electric roads will derive through reductions of operating costs to be obtained by placing both lines under one management.

Properties acquired by the Rochester & Syracuse line are: Syracuse to Oswego interurban electric road; Oswego city lines; Auburn and Port Byron interurban line and branch lines in Auburn.

Although the Rochester & Syracuse and Empire State lines will retain their present identities, they will be under one management. The Rochester road is being operated by Peck-Shannahan-Cherry, Inc., with active management in the hands of Talmadge C. Cherry, first vice-president and general manager. The same organization will assume management of the Empire State Railroad, which will give up its present offices and the two roads will be combined in the present Rochester & Syracuse offices in the Syracuse Savings Bank building.

Directors expressed confidence that the material reduction in operating costs due to joint operation, to be effective as soon as the Public Service Commission approves the purchase of the Empire State road, will result in the class B preferred stock of that line reaching a dividend paying basis. The B stock of the Empire State road has paid no dividend to date, while the Rochester & Syracuse line has paid 4 per cent on its preferred stock for two years.

The Rochester & Syracuse Railroad was organized several years ago. When the Empire United went into the hands of receivers on Nov. 1, 1915, holders of bonds issued on the mortgage covering the unit from Syracuse to Rochester organized a bondholders' protective committee. Mr. Loasby was chairman and Mr. Settle and Mr. Harvey were the other members. Mr. Cowie served in the capacity as counsel for the committee.

When the mortgage was foreclosed, the protective committee bid in the Rochester line for approximately $1,000,000. The Rochester & Syracuse Railroad Company, Inc., was then organized, and in the recapitalization the corporation issued $2,500,000 in bonds; $2,500,000 in preferred and $1,500,000 in common stock.

Arthur W. Loasby was the first president of the reorganized corporation. When Mr. Loasby accepted the position as a vice-president of the Equitable Trust Company of New York, of which he is now senior vice-president, Mr. Cowie was elected president of the Rochester & Syracuse road. Mr. Cherry has held the office of first vice-president and general manager since the reorganization in 1915. Mr. Chase, president of the First Trust & Deposit Company, is second vice-president.

Another bondholders' committee made up of persons interested in the Beebe enterprises bid in the units now included in the Empire State Railroad Corporation, which is now managed by Ford, Bacon & Davis of New York, with J. C. Nelson as president. The road has $2,750,000 worth of bonds outstanding. It also has 2,500 shares of A preferred stock, par value $250,000; 12,500 shares B preferred, par value $1,250,000, and 14,500 shares of common stock with a $1,450,000 par value.

First Report Since 1914 Submitted

The eighth annual report of the board of directors of the Mexico Tramways, Mexico City, Mexico, has been submitted to the shareholders with an appendix report by G. R. G. Conway, managing director, on the company's operations and undertakings for the year 1921. This is the first report since 1914. At that time conditions in Mexico were disturbed. Upon their growing worse the tramways was seized by the government, which continued to operate them until May, 1919, when the property was returned to the company in a very run-down condition.

The gross earnings for 1921 amounted to $13,075,291 (pesos), an increase over the year 1920 of $2,069,160 (pesos). The net earnings after allowing for taxes and depreciation were $2,335,436 (pesos), an increase of $681,844 (pesos) over the previous year. The report makes mention of the "unorganized competition" which had to be encountered owing to the introduction of small "camiones" (jitneys), which number about 1,550, operating daily and carrying approximately 132,000 passengers per day.

The report says that in considering the operating results for the year 1921 the special condition under which the company had been operating must be taken into account, and particularly those which obtained when the properties were returned to the company in May, 1919, after having been administered by the Mexican Government since Oct. 12, 1914. The run-down condition of the property will continue to affect the net earnings of the company even for the next few years. Since the return of the property wages have been increased nearly 100 per cent, with an increase in the number of employees, chiefly in the traffic department.

However, in the opinion of the managing director, the company's property is now in good condition, since the most urgent and necessary reconstructions have been carried out. He added that maintenance expense would probably continue high, as much had to be accomplished during the next few years.

I. R. T. Doing Well on Basis of Readjustment

If the Interborough-Manhattan readjustment plan had been effective during the year ended June 30 last the Interborough Rapid Transit Company, New York, N. Y., would have shown a balance of $4,011,523 instead of a deficit of more than $2,000,000, according to information presented on Dec. 5 by Frank Hedley, its president and general manager, in a letter to the bondholders' and noteholders' committee.

Mr. Hedley stated that the company under the terms of the agreement was about to issue $34,330,000 ten-year secured convertible 7 per cent notes to retire and refund 90 per cent of the outstanding three-year issue. His comment was that under the new plan the company's fixed charges had been materially reduced. He showed the effect of the plan graphically by deducting from the known results of operation for the last fiscal year the interest (but not sinking fund) on the I. R. T. bonds, the interest on the new I. R. T. notes and on the Manhattan Railway bonds. Such a statement follows:

YEAR ENDED JUNE 30, 1922	
Operating revenues	$53,540,859
Operating expenses, etc.	37,557,965
Operating income	$15,982,894
Non-operating income	652,875
Gross income	$16,635,769
Interest on I. R. T. bonds, new notes and Manhattan Railway bonds	12,624,246
Balance	$4,011,523

Mr. Hedley said that 1923 results should be at least as favorable as those indicated for 1922 in the table he presented.

The letter continues:

> In view of the substantial increase in the number of passengers carried on the system during the first five months of the fiscal year and also because of the greater economies of operation which are being obtained, there is every reason to believe that the actual results for the fiscal year ending June 30, 1923, will be at least as favorable as those indicated in the table above.

Planning to Operate Recently Sold Line

Following a mass meeting at Weaverville, N. C., efforts are being made to form a stock company to take over and operate the Asheville & East Tennessee Railway Company, an electric line extending from Asheville to Weaverville. The road was sold on Nov. 28 by receivers to S. Sternberg of Asheville and service was suspended the next day. Mr. Sternberg paid $19,000 for the property and is offering it to the proposed new company for $20,000. He has given an option on the property until Dec. 11.

If the new company fails to raise the desired amount and the plan fails the road will be junked. The road made money above operating expenses during the receivership, according to J. S. Coleman, receiver. If the new plans are completed the offices of the road will be moved from Asheville to Weaverville and the cars will not be run into the center of Asheville, but only to Grass, a suburb of Asheville, which has the city car service.

Securities at Auction

Electric railway securities sold by Adrian H. Muller & Company on Dec. 6 at the Public Auction Room, 14 Vesey Street, New York, were as follows:

$7,000 Second Avenue Railroad first consolidated mortgage 5 per cent bonds, due 1948, Guaranty Trust Company certificates of deposit, 1⅜ per cent.

$59,000 Dry Dock, East Broadway & Battery Railroad registered refunding mortgage income gold bonds, series C, due 1950, with $10 scrip, $300 lot.

$24,000 Denver Tramway Terminal Company thirty-year 5 per cent bonds, due December, 1933, 85 per cent.

Financial News Notes

Property Valued.—In the report of Engineer A. E. K. Bunnell of the Toronto Transportation Commission the valuation of the London (Ont.) Street Railway is fixed at $1,000,000. The report says that this figure refers to its physical value.

Hearing Postponed.—The hearing on the application of the Continental Securities Company for the appointment of a receiver for the Interborough Rapid Transit Company, New York, N. Y., because of a threatened default in interest on securities was recently deferred by Judge Mayer until Jan. 26.

Stockholders to Decide Two Issues.—Stockholders of the Public Service Corporation of New Jersey, Newark, N. J., will vote at a special meeting Dec. 18 on the recent recommendation of the directors that the preferred stock be divided into two classes and that the corporation relinquish its option to redeem the stock at 110.

Traffic and Transportation

Reasons for Removing Toledo's One-Man Cars

Council, Exercising Rights Invested in It by Service-at-Cost Franchise, Swayed by Packed Union Meeting Into Ruling Cars Off Streets

NOW that one-man cars are definitely removed from the streets of Toledo, Ohio, the next problem is to meet the constantly increasing demand for improved service, for which the necessary finances are not available. There have been many angles to the one-man car issue in this city and they have been dealt with previously in these columns. Chronologically, the story of the one-man car dates back to July 1, 1922, when the Community Traction Company, acting upon a suggestion of the City Street Railway Commissioner, equipped its Bancroft belt line with rear-entrance, pay-leave, one-man turnstile cars, using for this purpose ten double-truck pay-enter cars. These cars were equipped with all safety features and Syracuse turnstiles on the rear platforms. After three months of continuous service a check of the results obtained indicated that service had been improved about 6 per cent in frequency, that regularity of schedules was quite as good as had prevailed with two-men cars, that riding had increased on the Bancroft line in greater proportion than on the balance of the city system and that a net saving of approximately 22 per cent was being made in platform expense.

These results seemed to justify a more extensive use of this type of equipment. On Oct. 16 two other and more important lines, Cherry and East Broadway, were equipped with Peter Witt cars operated by one man. Unfortunately, the attempt to load and unload passengers at the front door developed serious congestion that could have been relieved by loading through a turnstile at the center door. However, as a protest against the use of one-man cars had developed in the City Council, it was deemed inadvisable to confuse the issue by installing turnstiles.

Right at this point it ought to be explained that under Section 14 of the Toledo service-at-cost grant, in effect since Feb. 1, 1921, the city has reserved to itself, to be exercised through the City Council, the entire control of service, including the right to fix schedules and routes, the character of cars and the right to increase or diminish service.

On Aug. 21 there was introduced into the Council a resolution providing: "That Council go on record as against the installation of any more one-man cars until such body is convinced that that is the proper way of handling street car traffic in the city of Toledo."

This resolution was referred to the Council committee on railroads and telegraphs and by that committee referred to a special sub-committee of three, who were instructed to investigate and report back to the committee on railroads and telegraphs. This sub-committee, on Sept. 11, after carefully considering the matter, recommended that the cars be continued for a further trial. On the strength of this recommendation the two lines above noted were equipped with one-man cars. The next step was the entrance of the local carmen's union. Section 43 of the wage agreement with the platform men, effective May 21, 1922, to May 21, 1923, after providing for the immediate continuance of the 1921 wage scale, recites:

> It is further provided that should the stabilizing fund as prescribed in the Community Traction Company franchise ordinance be less than the sum of one hundred twenty-seven thousand three hundred dollars ($127,300) on Nov. 30, 1922, the present wage scale will then be automatically reduced to the scale in effect under the 1919 agreement between the association and the Toledo Railways & Light Company, which wage scale will then be operative until May 21, 1923.
>
> One-man car operators to receive 5 cents per hour additional.

While in the early stage of their use some criticism of these cars on the part of the public arose but gradually died down, no protest against the use of one-man cars developed from the union, according to Commissioner Cann, until it was evident that the fare stabilizing fund would on Nov. 30 materially exceed the specified amount of $127,300.

As a result of this well organized and vigorous protest, on Oct. 11 the question of continuing the use of one-man cars was reopened and the members of the local street car union were invited to meet with the committee on railroads and telegraphs one week hence and at that time present their objections to this type of equipment. The subsequent meeting resulted in the Council chamber being packed to capacity with a lobby, 90 per cent of whom were car men and their sympathizers. At this meeting several operators of one-man cars voluntarily appeared before the committee, were questioned as to their length of service and asked for their opinion as to the practical utility of the one-man car. In each case these men, of long experience as electric railway employees, positively stated that, in their opinion, one-man cars could be operated in Toledo with safety and convenience to the public.

After hearing the remarks of the business agent of the local union the committee indorsed a resolution condemning this type of equipment. On Oct. 23, at the regular meeting of the Council, fifteen of the twenty members of that body voted to prohibit the further use of these cars.

One week later Mr. Cann, the City Street Railway Commissioner, appeared before the Council and recommended that cars be continued in operation for the full thirty days permitted by the city charter before the resolution would become effective, and that in the interim a special committee of five be appointed to accompany him on a trip through the East to observe and investigate the operation of similar equipment in Eastern cities. This suggestion was adopted and the special committee appointed. A local election delayed the departure of this committee and at the next regular meeting of the Council the action authorizing the Eastern investigation was rescinded, thirteen of the nineteen Councilmen present voting against any further consideration of the matter. This action met with the heartiest approval of the packed lobby that attended the meeting.

The following week the Street Railway Commissioner exhibited to members of the Council a Peter Witt car equipped with a turnstile in the center door, carefully explained all of the features of the car and suggested that the previous action of Council be rescinded so as to permit a trial of that particular type of car on the Bancroft belt, the line upon which the initial installation of one-man cars had been made and from which no public protest had been heard. Fourteen members pledged their support of this recommendation, but at a meeting of the Council that same evening a packed lobby again stampeded their good intentions and all but three of them voted against any further use or experiment with one-man equipment.

Reduced Fares for Wheeling

Fare reductions ranging from 6 to 25 per cent will be put into effect by the Wheeling (W. Va.) Traction Company on Dec. 17, according to G. S. Wills, general manager of the company, who stated that the cut would bring the "nickel ride" to Wheeling again after an absence of two years. Mr. Wills declared the fare cut was an experiment to stimulate traffic and that in the event of it failing the company would have no alternative but to swing back to the basis it is now abandoning.

Mr. Wills' statement follows:

> The new tariffs will eliminate the present major and minor or short zoning plan, as now in effect, and return to longer unit zones, somewhat the same as were in effect between May 29, 1919, and Dec. 26, 1920. Under the new zoning, universal tickets at 5 cents each, good for a one zone ride on any part of the system, will be placed on sale at our ticket offices and by conductors on cars in strips of ten for 50 cents.
>
> All single zone rides paid for in cash will be 8 cents, while rides in excess of one zone will have a cash fare rate, not a multiple of 8 cents, but either practically the same as the universal ticket rate or 5 cents in excess thereof, depending entirely on density of travel between the points ridden.
>
> In further recognition of the fact that the cost of street car service per passenger is less in dense riding and as an inducement to street car riders to increase their patronage, special strip tickets, purchasable in 50-cent strips, good at all hours and without restrictions, will be placed on sale at our offices and by our conductors at rates per ride lower than those obtained under the universal ticket rate.

One-Way Traffic Recommended

A report has been submitted to the City Council of Portland, Ore., by members of the special traffic committee appointed by Mayor Baker in which one-way traffic for both vehicles and street cars is recommended as a partial solution of the traffic congestion in the city streets.

The committee in its report states that it has come to the unanimous conclusion that any solution of the congestion problem must affect not only automobile and vehicular traffic, but the electric railway system as well. Traffic conditions in the city are largely affected by the trans-Willamette River bridges and their approaches, the report points out, and urges a comprehensive change for the betterment of waterfront conditions by widening bridge street approaches and effecting permanent grades near the waterfront.

In recommending one-way traffic, certain of the wider streets have been excepted, especially for street car traffic.

The report points out that one of the largest contributing causes for the congestion during rush hours is the interurban traffic of the Portland Railway, Light & Power Company, the Oregon Electric and the Southern Pacific Company. "It is important and essential in our judgment," the report says, "that in any permanent solution of the traffic problem a feasible plan should be worked out for the routing of these trains."

The committee recommends adjustment of street railway traffic to conform to the general plan by the construction of loops and several new lines. The report points out that the cost of changes in new track construction contemplated under the plan had been estimated by the city engineer's office at $182,000 and by officials of the Portland Railway, Light & Power Company at $192,000. Additional crossovers and track changes that officials of the company declare are necessary for convenience and for emergencies would bring this cost to the railway company to a total of $231,000. Detailed suggestions for street car track changes, adoption of an automatic signal traffic control and regulations covering foot traffic are also embodied in the report, which the Council will take under consideration.

Joint Freight Service Extended

Joint arrangements have been completed, effective Dec. 6, for freight service by the Northern Ohio Traction & Light Company with the Detroit United Railway reaching the cities of Detroit, Jackson, Saline, Flint, Pontiac, Port Huron, Imlay, Algonoc, Northville and other points and by the Northern Ohio Traction & Light Company with the Nickel Plate for service to Buffalo and intermediate points. The tariff filed in the latter case is effective after thirty days. A joint arrangement has also been made with the Cleveland, Southwestern & Columbus Railroad, Columbus, Marion & Bucyrus Railway and the Columbus, Delaware & Marion Electric Company, all of which operate electric roads, for service to Columbus and intermediate points via Mansfield and Galion. The tariff filed for this service is effective in ten days. This gives freight service for the lines of the Northern Ohio Traction & Light Company east to New Castle, Pa., northeast to Buffalo, northwest into Michigan and southwest into Columbus.

These in brief are the new arrangements just made. They are in effect an extension of similar activities of the Northern Ohio Traction & Light Company dating back a considerable time. As recently as last April, however, the Northern Ohio Traction & Light Company, in conjunction with the Cleveland, Southwestern & Columbus Railway, Cleveland, Alliance & Mahoning Valley Railway, Stark Electric Company and Pennsylvania-Ohio Electric Company, entered the freight field in a joint service covering northern Ohio. The company also made an arrangement with the Detroit & Cleveland and Cleveland & Buffalo boat lines, and only recently the Lake Shore Electric Railway has come into the organization. Radiating from Cleveland, this freight service reaches the industrial cities of Akron, Cuyahoga Falls, Barberton, Wadsworth, Canton, North Canton, Massillon, Dover, Uhrichsville, Kent, Ravenna, Alliance and Youngstown, as well as Elyria, Berlin Heights, Birmingham, Wellington, Strasburg, Newton Falls, Atwater, Salem, Warren, Niles and numerous other smaller towns within a distance of 100 miles.

Declines to Cut Fare

The Public Utilities Commission on Dec. 1 denied the application of the Federation of Citizens' Associations for a reduction in fare on the lines of the Capital Traction Company, Washington, D. C. As a result of the decision the present rate of six tokens for 40 cents or 8 cents cash fare will remain in effect on both the lines of the Capital Traction Company and the Washington Railway & Electric Company.

The counsel for the association was William McK. Clayton, who argued that it was discrimination on the part of the commission to continue the same rate of fare on both systems when that rate netted the Capital Traction Company a bigger return than the Washington Railway & Electric Company.

The commission in its verdict included the opinion of Corporation Counsel Stephens, who maintained that the commissioners were entirely within the law in maintaining a uniform rate of fare. The argument of Counsel Stephens was referred to in the *Electric Railway Journal* issue of Dec. 2.

In concluding the decision the commission said that no sufficient reason had been shown to justify a change in policy which was based "upon the interest of the entire public in the preservation of efficient and dependable street railway transportation in all parts of the District."

Improvement in Glendale Railway Service in Prospect

The Riverside Portland Cement Corporation, which controls the Glendale-Montrose and La Crescenta Railroads, operating car lines in a portion of the city of Glendale, Calif., and also operating a line between Glendale, Montrose and La Crescenta, has fully completed its plans for the complete rehabilitation of the property with a view of giving better service in this locality.

The owners of the lines have acquired the right of way of the Union Pacific System on Glendale Avenue in the city of Glendale and plan the establishment of a high class transportation service at a very reasonable rate between La Crescenta, Sparr Heights, Montrose, Glendale and Los Angeles.

The citizens of La Crescenta, Montrose and Glendale have subscribed a bonus of $25,000, and the railroad has agreed to spend $150,000 in the reconstruction of the line. It is the plan to reconstruct and improve the roadbed and electrify the line from La Crescenta to the junction of Glendale Boulevard with San Fernando Boulevard. At this junction the new service will connect with and transfer, without extra charge, to the Los Angeles Railway Corporation's line, giving passengers access to all parts of Los Angeles on a single fare.

The company proposes to furnish new, modern cars and will establish a fifteen-minute service during the rush hours.

Work on Loop Temporarily Halted

Request of George P. Carrel, Mayor of Cincinnati, Ohio, that work on the rapid transit loop be stopped until a time when the city was in better finances has been complied with by the Rapid Transit Commission. At a meeting of the commission on Dec. 1 the members decided not to ask for further bond issues, because of the present financial condition of the city, but to proceed with the work until the present supply of money was consumed. The members explained that there is enough money left in the commission's coffers to continue the loop to Spring Grove Cemetery, at which point the Ohio Traction Company, Dayton division, will be invited to operate its cars into the city.

The proposed interurban line from Indianapolis to Cincinnati, of which the Connersville-Cincinnati stretch remains to be completed, is expected to run into the loop system over the Ohio Traction line and will augment the rolling stock.

Mayor Carrel's request that work be stopped on the rapid transit loop was made at a called meeting of the Rapid Transit Commission Nov. 17. There were present the heads of all the city departments and members of the Rapid Transit Commission. There was no decision reached at the meetng, but the commission took the Mayor's request under consideration.

The Rapid Transit Commission has

reorganized—E. W. Edwards, metal products manufacturer, is chairman; Attorney E. M. Dornette, vice-chairman, and former Judge William Geohegan, secretary.

Discuss Weekly Pass Plan

Members of the City Council utilities committee, Seattle, Wash., recently listened to an extended discussion of the weekly street car pass system by Councilman John B. Carroll, its only advocate in the Council, and B. H. Petley, a civil engineer, who has been interested in the plan for more than a year. Major Carroll suggested that the committee recommend to the Council the adoption of the pass system, contending that the urban street car lines are suffering more and more from the competition of privately owned automobiles. Under the pass system, he maintained, extensions could be hoped for, but not under a 5-cent schedule. Other members of the Council expressed the opinion that the weekly pass has merits, but agreed that its adoption would lead away from the city's ultimate goal of 5-cent fare for all riders.

Transportation News Notes

Five-Cent Fare Provided.—Everett, Wash., will again have a 5-cent fare provided in the filing of a tariff by the Puget Sound International Railway & Power Company for a period of ninety days. The tariff also provides for the extension of the weekly pass system for another ninety days from Nov. 25, both tariffs being permitted to become effective on less than statutory notice.

New Service Plan Given Trial.—The City Railway, Dayton, Ohio, recently put into effect a new plan for speeding up service during rush hours. In the downtown section at each of the principal street intersections employees of the company are stationed who are to go among the people about to board the cars and make change for those who have not the exact fare ready. This plan was started owing to the difficulty experienced by the motormen of the one-man cars in making change for patrons.

Petitions to Operate Buses.—The International Railway, Buffalo, N. Y., has petitioned the City Council for permission to operate double- and single-deck motor buses on Delaware Avenue from The Terrace to the Kenmore-Buffalo city line and on Bailey Avenue. Two buses of the Fifth Avenue type with the enclosed upper deck were brought to Buffalo from Philadelphia by Herbert G. Tulley, president of the International and inspected by members of the City Council. Two other similar petitions are before the Council for the operation of buses of this type in Buffalo.

New Publications

The Constitution of the United States

Its Sources and Its Application. By Thomas James Norton. Little, Brown & Company, Boston, Mass. 1922. 298 pages.

There are many great works on the Constitution, but most of them were written for the legal profession and are so formidable in appearance as to deter anybody but the law student from venturing upon a reading of them. Mr. Norton's work is, perhaps, the first of its kind to overcome all the objections which have been made in behalf of the lay reader to previous volumes dealing with the same subject. This fact alone ought to be enough to secure for it a wide vogue among business men and engineers everywhere who in the past have turned away from books bearing the legal stamp. It is not in any sense a railway book, but it is a work that the railway man can hardly afford not to list among the volumes intended to be used by him in his collateral reading.

As the author explains the purpose of this book, it has been his effort to make accessible to the citizen and his son, to his newly enfranchised wife and daughter, and especially to his children in school, such a knowledge of the Constitution of the United States as will serve in emergency as a "first line of defense." This purpose has been achieved and a great deal more. The treatment of the subject is unusual in that the book explains, clause by clause, the origin of the leading provisions of the Constitution and the Amendments and then gives their application in the great cases which have arisen from the beginning down to the apartment-house rent case in 1921.

In carrying out his purpose the author has provided a note to every line or clause that has a historical story or drama back of it, or that has contributed to the national or the international welfare of mankind during the 133 years of life under this instrument. This method leaves the text of the Constitution and the Amendments in unbroken connection, so that the whole great design is visible, and the explanation appears immediately under the part to be explained. As to the typographical arrangement of the book, the text of the Constitution and Amendments is printed in large type, while the explanations of the clauses are not mere footnotes, but are given the typographical prominence they deserve by being made part of the text.

In addition to a showing of the historic sources or causes of particular provisions of the Constitution, there are also exhibited examples of the application of the clauses in great cases which have arisen during our constitutional life. It is illustrated very clearly that the man in power has undergone no change and that without the prohibitions of the Constitution and the means of giving them immediate effect he would become as dangerous as he ever was to the safety of the government and to the rights and liberties of the people.

A New Edition of "Pender"

Handbook for Electrical Engineers. Compiled by a staff of specialists, with Harold Pender as editor in chief and William A. Del Mar as associate editor in chief. Second edition, revised and enlarged. John Wiley & Sons, Inc., New York, N. Y. 2,263 pages.

Eight years ago the first edition of what was then called the "American Handbook for Electrical Engineers" was issued, under the editorship of Professor Pender. Since that time a number of changes have occurred in the field of electrical engineering, and two years ago the publishers undertook the complete revision of the handbook.

Of the approximately 2,200 pages (excluding the index) 158 pages or about 7 per cent are devoted to electric traction. This excludes steam locomotives and electric automobiles, which while listed under Traction are not electric railway subjects. Electric traction may, therefore, be said to have been given a fair amount of space in the book. Under the subject of traction the topics given most extended treatment are energy requirements and motor equipment for electric railways, overhead trolley systems, third rail, and signaling. These take nearly two-thirds of the space. The material here seems to be accurate and as nearly up to date as is possible in a field in which practice is so rapidly changing as it is in the electric railway field at present. However, for the electric railway engineer the handbook has its principal value outside of the electric railway section. What the engineer expects a handbook to contain is primarily the fundamental principles and data of the field which it covers and the standardized items in those fields. This the "American Handbook" does in a thorough manner. Like the "Standard Handbook," the publication of the fifth edition of which was mentioned briefly in the issue of this paper for Oct. 14, 1922, page 652, "Pender" includes the complete "Standards of the A.I.E.E."

Fusibility of Ash from Coals of the United States

Fusibility of Ash from Coals of the United States. By W. A. Selvig and A. C. Fieldner, United States Bureau of Mines, Department of the Interior, Washington, D. C.

As the fusibility of the ash in coals determines the clinkering quality, information regarding fusing temperatures, etc., is of value to coal users who desire to operate their boiler or other furnaces with the maximum of intelligence. This report emanating from the chemical laboratory of the Bureau of Mines contains a wealth of data as to coals from all parts of the country.

Personal Mention

Fifty Years in Railroading in Chicago

Sixty Friends of John M. Roach Fete Him on Half Century of Work There for Local Roads—Rehabilitation of 1908 Carried Out During His Administration

JOHN M. ROACH, member of the board of operation of the Chicago Surface Lines, was the guest of honor at a dinner recently to celebrate the fiftieth anniversary of his connection with transportation companies in Chicago. Directors of the several companies, heads of departments and old time friends made up the party of sixty who took part in this testimonial event.

Only a few days before Mr. Roach was honored as the senior past-president of the American Electric Railway Association at a gathering of past-presidents during the convention in Chicago. On that occasion, the presiding officer, Gen. George H. Harries, said of him:

"Mr. Roach is a transportation man through and through, but he is by no means through."

It is a far cry from work as a cowboy and miner to that as the president of a great transportation system. That was the range covered by the subject of this sketch. It is characteristic of Mr. Roach that he learned from each experience in life the lesson it contained, and as the years have passed he has developed executive force, keen discrimination and managerial ability which today mark him as a prominent figure in Chicago's business circles.

Mr. Roach's advancement has been due to his own efforts rather than to fortuitous circumstances. He has an unusual capacity for work and for organization. His knowledge of men is perhaps his strongest characteristic, and while he has been out of active management of the street railways for the last ten years, he still is loved by thousands of the men who served under him and who are still with the properties.

Mr. Roach was born in Lowell, Ohio, in 1852. At the age of eighteen he was attracted by the story of gold discoveries in Montana and went with a party of young men from his home in Belvidere, Ill., on the long Western trip on horseback. The visions of wealth vanished after an attempt at mining, and the young man then tried his hand at ranching and newspaper work. In October, 1872, he went to Chicago and was at once attracted by the possibilities of advancement in street railway work. He had a letter of introduction which would have secured him a position in the office of the general manager of the company, but he expressed preference for employment as a conductor "so he could learn the business from the car up."

A few years later he became cashier of the North Chicago Street Railway, and then purchasing agent. In 1890 he was made general superintendent of all the North Side lines and three years later became also vice-president. In 1897 he assumed similar titles with the West Chicago Street Railway, and, when the Union Traction Company took over both properties, he continued in direct charge of the management. He was the first president of the Chicago Railways, which took over all the North and West Side lines under the 1907 ordinances. He retired from active management in 1912. With the merger of all the Chicago street railways under the name of the Chicago Surface Lines in 1914, Mr. Roach became a member of the board of operation. He also continues as vice-president and director of the Chicago Railways.

J. M. ROACH

When Mr. Roach went to Chicago, it was a city of 300,000 population, with an area of 36 square miles and with only 40 miles of car tracks. It is now a city of 2,701,000 persons, with an area of 200 square miles and has more than 1,000 miles of surface tracks.

Another instance of the growth of Chicago during Mr. Roach's service with the companies is that a single fare in 1872 would purchase a ride of only 2 miles, whereas now it is possible to ride 35 miles on one fare with unlimited use of transfers.

Mr. Roach saw the introduction of the cable system in 1882 and the trolley system beginning in 1890. It was during his administration that the properties were rehabilitated with new tracks, cars and substations, beginning in 1908. This record for reconstruction work in three years is said to have been unequaled in traction history.

Outside of business, Mr. Roach has two hobbies—golf and baseball. He enjoys watching the big league players and gets much pleasure out of the comradeship of the links. He plays a good game, too. He has an office with the executive staff in the Borland Building, but is also to be found daily at his old headquarters on the North side, where he served so many years in active management. Many an old employee calls on him there, finding the latchstring always out and securing helpful advice when the occasion warrants. An Eastern financial journal recently said:

"Roach is a great operator; nobody knows the traction game better."

It might have said with equal truth:

"Roach is a true friend; no one knows better how to make and retain friends."

Senator Couzens Wants to Help Detroit Municipal Railway

James Couzens, appointed to the United States Senate by the Governor of the State of Michigan to fill the vacancy caused by the resignation of Senator Newberry, has resigned as Mayor of the city of Detroit. While the belief has been expressed by members of the Street Railway Commission that Mr. Couzens will remain as head of the street railway department, the Senator-elect stated that he would have nothing to say on street railway matters until he had talked with Corporation Counsel Wilcox, with acting Mayor Lodge and with members of the Street Railway Commission.

Protest was made to Governor Groesbeck by citizens of the city of Detroit who saw in Couzens' appointment to the Senate the loss of his services to the city. Since the time when the Street Railway Commission granted Joseph S. Goodwin, general manager of the municipal system, a leave of absence for six months because of his illness, Mr. Couzens had been devoting half of his time to active management of the Municipal Street Railway system.

It was pointed out by supporters of the municipal system that many years devoted to the study of Detroit's transportation problem and years spent in overcoming obstacles placed in the way of municipal ownership had given Mr. Couzens an unusual insight into Detroit's needs and the solution of the city's problems.

In accepting the appointment to the Senatorship, Mr. Couzens states that if he might continue to serve the people of Detroit legally and with the consent of the new Mayor and the members of the Street Railway Commission, he was willing and anxious to do so. Citing that with the consent of the Council men have been selected to consider the further development of Detroit's transportation needs, such as subways, elevated and bus lines, he stated that if he in any way felt that Detroit would be inconvenienced by his accepting the appointment, he would decline to do so.

Celebrates Fifty Years of Business

Some sixty of the personal and business friends of Daniel M. Brady were guests of the directors of the Brady Brass Company at a luncheon at the India House on Dec. 6. The occasion was the completion by Mr. Brady of a service of fifty years in the railroad industry and of forty years in the metal trade. Gathered around the tables were many men prominent in business and steam railroad circles in New York, as well as from the electric railway companies of the city. Letters read by H. H. Vreeland, Interborough Rapid Transit Company, indicated that many other steam railroad officials would have been present if the luncheon had not occurred at the same time as the meeting of the American Railway Association in Chicago this week. As the affair was in the daytime the speeches were limited to few, but J. F. Fowler, vice-president W. R. Grace & Company; C. S. Tench, editor *American Metal Market Report*, and Henry A. Bishop, director of the company, spoke, and Judge Morgan J. O'Brien acted as toastmaster. At the conclusion of Mr. Bishop's speech he presented a gold watch to Mr. Brady, in behalf of the directors of his company. In his reply Mr. Brady said that the greatest asset which a person could have was friends, and friends could be gained best by gratitude and loyalty.

Mr. Brady was born in New York City sixty-nine years ago and in 1871 entered the employ of the New York Central Railroad in the office of General Manager John M. Toucey. He was afterward chief clerk of the car department under Leander Garey, general superintendent of the car department of the company. Mr. Brady resigned from the New York Central Railroad in 1883 to join the then newly organized Paige Car Wheel Company, Cleveland, with which he was connected for a number of years. In 1888 he established the Brady Brass Company and has been president of it since its organization. For many years he was also director of the Rochester Car Wheel Works. At the time of the reorganization of the American Street Railway Association in 1905, he had a great deal to do with the organization of the American Street Railway Manufacturers' Association, and was the first president of that organization.

Mr. Kirk Sioux City President

E. L. Kirk is now the president of the Sioux City Service Company following a consolidation with the Sioux City Gas & Electric Company on Nov. 1. Mr. Kirk was office manager for the Riverside Park Railway from 1891 to 1894 and receiver for this company until 1899, when this road and four other lines were consolidated under the name Sioux City Traction Company. He remained as general manager for this firm from 1900 until 1905, when this company was absorbed by the Sioux City Service Company, thereby bringing electric light and power service under this organization. Mr. Kirk continued as general manager of this concern until his recent promotion to the presidency.

Messrs. McIlraith, Allen, Hamilton and Aycock All Resign from P. R. T.

The resignation of G. A. Richardson as vice-president in charge of operation of the Philadelphia (Pa.) Rapid Transit Company, noted in the *Electric Railway Journal* for Dec. 2, was followed by the resignation on Dec. 3 of:

E. J. McIlraith as superintendent of rolling stock and buildings,

Elbert G. Allen as chief engineer,

F. M. Hamilton as assistant to the president, and

N. M. Aycock as superintendent of car maintenance.

Quite naturally the Philadelphia papers have expressed great surprise at the announcement of these changes. The stories some of them print of internal dissension are so extravagant as to be fanciful. Whatever the reasons may be for the retirement of officials en bloc, as it were, Mr. Mitten's searches in the past for the best available talent make the statement seem absurd that appears in the *Ledger* and credited to a reliable informant to the effect that "Mr. Mitten's policy of 'taking glorified office boys and endeavoring to create street railway officials of them by his mere say-so' proved very distasteful to the experienced street railway men."

However, some of the resignations must have been unexpected, for official departmental order No. 4 indicates as much. That order, dated Nov. 13, was signed by G. A. Richardson as vice-president and approved by Mr. Mitten. It says that F. M. Hamilton will become assistant to the president. Mr. Hamilton is one of the four who, according to the announcement of Dec. 3, has quit the service.

Recent official announcements of the company in effect on Dec. 3 follow:

"Effective Dec. 1, 1922, R. T. Senter, now assistant to the president, will become vice-president in charge of engineering, this to include such part as P. R. T. may take in city transit development.

"Until the appointment of a successor to G. A. Richardson, whose resignation takes effect this date, R. F. Tyson, assistant to the vice-president in charge of operation, will, with the aid of the undersigned, assume the duties of the position thus made vacant.

"Leon Jewell will move to 1520 Spruce Street and assume the duties of the newly created position of traffic manager of the system, in charge of timetables, traffic checks and traffic income estimates.

"W. R. Scanlin will assume the duties of the newly created position of assistant to the chief engineer.

"Effective Dec. 1, G. H. Stier is appointed superintendent of rolling stock and buildings."

Funeral Services for A. E. Duty

Funeral services for Albert E. Duty, assistant general manager of the Cleveland (Ohio) Railway, were held in Cleveland on Dec. 2. Mr. Duty died at the age of 69 following a brief illness, although he had not been in good health for almost a year.

He had spent fifty-three years in the street railway business in Cleveland, being the only executive outside of John J. Stanley, president of the company, whose services spanned the period from horse-car to electric line.

Mr. Duty began his street railway business as a driver for the Woodland and South Side Railway Company line. In 1883 he became assistant superintendent for the Cleveland City Railway. In 1912 he was made general superintendent, continuing in that post until last February, when he was promoted to be assistant general manager.

Mr. Duty was a Clevelander all his life. He is survived by his wife, a brother, who is superintendent of construction with the Cleveland Railway, and five sisters.

Peter M. Kling Dead

Peter M. Kling, for a number of years general manager of the St. Louis Car Company and later with the John Stephenson Company, Elizabeth, N. J., in a similar capacity, died at his home in Detroit on Nov. 25. He had not been in good health for the last two years.

Mr. Kling was born in Denmark on July 24, 1855, and served his apprenticeship in that country as joiner, carriage and wagon builder. At the age of fifteen he came to the United States and located at St. Charles, Mo., where he worked for a few years in a country wagon and blacksmith shop. Later he went to St. Louis, where first he engaged in the manufacture of wagons, carriages and omnibuses, but later became associated with the Brownell & White Car Company, where he worked up to be foreman and superintendent. Still later he was largely responsible for the organization of the St. Louis Car Company and had a great deal to do with the design of that company's present shops.

He resigned from the St. Louis Car Company in 1900 to become general manager of the John Stephenson Company, which had recently moved its car works from New York to Elizabeth. When this company was purchased by another corporation in 1905, he resigned to assist in the organization of the pressed steel passenger car department of the Pressed Steel Car Company, Pittsburgh, and became general manager of that department. Since leaving the Pressed Steel Car Company, in 1909, he had been associated with the Brooklyn Rapid Transit Company, the Laconia Car Company and the Indianapolis Body Company. He leaves a widow, four sons and two grandchildren.

Mr. Kling was widely recognized as a man of sterling worth, with extended knowledge of car building.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE
MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES · BUSINESS ANNOUNCEMENTS

An Example of Merchandising Electric Locomotives

The sale and shipment of a 50-ton 600-volt electric locomotive within a period of five hours was the novel record established recently by the Pittsburgh office force and shop employees of the Westinghouse Electric & Manufacturing Company. In fact, the circumstances attending the sale of the locomotive, which was taken from stock, indicate that it is one of the very few cases on record of an electric locomotive being sold in a manner similar to the merchandising of staple goods, for the locomotive was actually sold "off the shelf."

COMES TO PURCHASE MUCH-NEEDED LOCOMOTIVE

A. A. Crawford, an official of the Youngstown & Ohio Railroad, which operates in the soft coal regions between East Liverpool and Salem, Ohio, recently went to the East Pittsburgh works of the Westinghouse company to purchase a much-needed locomotive, the two Westinghouse Baldwin locomotives used on the railroad being in service continuously twenty-four hours every day except four hours on Sunday, when they were taken into the shops for oiling and inspection.

Mr. Crawford arrived at the Westinghouse plant at 10:30 o'clock in the morning and immediately entered into negotiations for the purchase of a locomotive. Upon being informed that the Westinghouse company had a locomotive whose general design and operating characteristics, though not duplicates of the locomotives then in service on the railroad, were capable of giving the same service, the railroad official, pressed by a dire need due to the fact that a breakdown of one of the locomotives in use would result in congestion of traffic, signed the contract for the purchase at 3 o'clock.

The shop force was notified and, with complete service data on the railroad where the locomotive was to be used, a corps of workers immediately examined the locomotive, testing the motors for insulation, ringing out the main and control circuits and clearing up the other necessary items of inspection. At 4:30 o'clock, after the messenger had made his bunk in the cab, the locomotive was in the Pitcairn yards of the Pennsylvania Railroad.

PLACED IN SERVICE ALMOST IMMEDIATELY

The day after the sale the locomotive was at Leetonia, Ohio, and the following day was placed in service in hauling coal on the Youngstown & Ohio Railroad between Leetonia and East Liverpool, Ohio. It is believed also that the sale, shipment and placing in service of the locomotive within a period of less than three days established a record in this phase of railroad work.

$200,000 in Improvements

The Pittsburgh (Pa.) Railways, through Receivers Fagan, Tone and George, have filed a petition in the United States District Court asking permission to spend $211,300 for improvements to the system. The betterments and estimated costs are as follows:

Passing siding on West Liberty Avenue, $22,500; transformer at Library, $3,000; additional feeders on Brighton Road, $1,200; track reconstruction on Western Avenue, $57,500; track reconstruction on Eighth Avenue, Homestead and West Homestead, $40,000; crossing on East McKeesport division, $2,500; crossing over Braddock Avenue, Pittsburgh, $2,500; additional feeders on Eighth Street, Braddock, $750; heating boiler Ardmore carhouse, $1,500; additional poles on Electric Avenue, East Pittsburgh, $850; track reconstruction on Hamilton and Brushton Avenues and Tioga Street, $62,500; additional feeders and lights at the Tunnel yards and shops, $7,000, and additional vacuum boilers, $9,500.

Metal, Coal and Material Prices

Metals—New York	Dec. 5, 1922
Copper, electrolytic, cents per lb	13.90
Copper wire base, cents per lb	15.625
Lead, cents per lb	7.10
Zinc, cents per lb	7.50
Tin, Straits, cents per lb	36.25
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$7.50
Somerset mine run, Boston, net tons	3.875
Pittsburgh mine run, Pittsburgh, net tons	2.625
Franklin, Ill., screenings, Chicago, net tons	2.50
Central, Ill., screenings, Chicago, net tons	1.675
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	6.50
Weatherproof wire base, N.Y., cents per lb.	16.00
Cement, Chicago net prices, without bags	$2.20
Linseed oil (5-bbl. lots), N.Y., cents per gal.	90.00
White lead, (100-lb. keg), N.Y., cents per lb.	12.125
Turpentine, (bbl. lots), N.Y., per gal.	$1.51

Rolling Stock

Cleveland (Ohio) Railway has purchased Eclipse trolley catchers and Eclipse fenders for fifty new cars now under construction in the plant of the Kuhlman Car Company.

Kansas City (Mo.) Railways will purchase, it is reported, three new Differential dump cars with three compartments each. The total cost will not exceed $29,000.

Pittsburgh (Pa.) Railways has started the operation of eight new modern cars of steel construction to replace a similar number of the older and smaller type of cars on the Homestead and McKeesport routes.

City Railway, Dayton, Ohio, equipped its new cars with Eclipse trolley catchers. The cars were described in the *Electric Railway Journal* for Oct. 28 and the statement made that these catchers were of another type was in error.

Washington Railway & Electric Company, Washington, D. C., has ordered ten new one-man cars costing $75,000 and is remodeling seven more of its existing cars for one-man operation. The company already has fifty-five single-man cars so that the additional seventeen will give a total of seventy-two.

Track and Roadway

Fresno (Calif.) Traction Company will start within the next three months extending its lines to the city limits on both McKenzie Avenue and on Fresno Avenue. The McKenzie Avenue extension calls for 6,900 ft. of track for 1½ miles of new trackage.

Ephrata & Lebanon Traction Company, Lebanon, Pa., has been authorized through Henry A. Albin and Walter C. Graeff, receivers, to spend a sum not exceeding $3,100 for track and car improvements to enable the company to operate one man cars.

Chautauqua Traction Company, Jamestown, N. Y., and the **Buffalo & Lake Erie Traction Company** jointly will construct a short piece of track connecting the two lines in Westfield, N. Y. The commission holds that it is desirable in the public interest that the connection be made so as to facilitate the interchange of freight.

Power Houses, Shops and Buildings

Boston (Mass.) Elevated Railway will award the contract for building the new Harvard Square station of the Cambridge Subway to the Coleman Brothers. Owing to a controversial interpretation of bids the company was compelled to appeal to the Massachusetts Public Utilities Department to decide. The department awarded it to the Coleman Brothers.

Trade Notes

Republic Railway & Light Company, New York, N. Y., Pennsylvania-Ohio Electric Company and the Pennsylvania-Ohio Power & Light Company announce the removal of their New York offices to suite 2626, Equitable Building, 120 Broadway, New York City.

J. E. Slimp, for many years identified in the South and West with the railway and transmission field, has opened an office at 50 Church Street, New York. This will be the Eastern agency of the Pacific Electric Manufacturing Company of San Francisco, makers of high-tension oil circuit-breakers, air-break switches, choke coils, lightning arresters, fuse equipment, etc., for high-voltage transmission lines, Mr. Slimp later may take other lines of apparatus in the transmission field. For eighteen years he was connected with the Ohio Brass Company.

The Panacea for Railway Troubles Is Here

ANY ONE who read the interview with C. D. Emmons in last week's issue of this paper with the expectation of finding some great outstanding purpose which might account for his rise to the leading position in the industry, as well as chief executive of one of the prosperous utility companies, was doubtless disappointed. In fact, one of the important lessons that may be drawn from Mr. Emmons' remarks is the fact that there is no one great engineering or management feat that determines the prosperity or poverty of a railway system. The success of the undertaking lies rather in the accumulative effect of numerous small betterments and economies—the result of pursuing a policy of constantly striving for improvement with respect to every detail of operation all through a company. Mr. Emmons' success typifies that policy, for he has been open-minded about developments and agreeable to a trial of any suggested improvement that seemed at all practical and worthy.

The *Journal* has spoken many times before about the unfortunate attitude of some railway men in seemingly closing their eyes and minds to the detail advances of the art. They appear to be waiting for some panacea for all their troubles to take them out of their difficulties. Meantime they ignore or neglect the numerous things that are within reach, practical and proved, that would each play a part, if grasped, in modernizing and providing better service, reducing costs and attracting greater patronage. This applies both to operating methods and to equipment improvements, and devices that reduce costs.

The industry is by no means standing still. There may not be much expansion of track mileage going on, but there is an intensified activity with respect to developments that will surely keep the railways away from obsolescence and put them in line for profits, if the managements keep alive to progress and make the most of it. It is almost wholly a matter of a little improvement here and a little there, each in itself of no great moment, but summed up they make the panacea sought after.

National Standardization Will Not Reduce Engineering Committee Activities

NOW that the American Engineering Standards Committee is functioning, a question naturally arises as to its probable effect on Engineering Association committee work. Will the activities of the national committee supplant those of the several well-organized and effective committees which are now vigorously trying to improve the quality of electric railway construction and operating practices? They will not; in fact, the committee work, in the future, while it will be somewhat different in character from what it has been, will be similar in purpose and scope, and at least no less in volume. It would be unfortunate if this was not to be the case.

The A.E.S.C. is essentially a balance wheel. Its function is to insure steady progress, but not to supply initiative and motive power. Its stamp of approval of a design or practice will give prestige to that upon which it is placed, but no more. It will supply assurance that the subject has been thoroughly reviewed and will give to the users of a national standard the confidence in its value that comes from its all-round consideration by various experts.

It is true that at the Chicago convention certain topics were, in a sense, laid upon the table pending the inauguration of work under them by the A.E.S.C. This, however, was not done with the idea that the national committee would shoulder responsibility for them, but rather to prevent duplication of effort. The elimination of such duplication will certainly be a relief to the Engineering Association committees and will give them more time for research. It will not, however, render any of them superfluous. The Engineering Association will require representation upon all national committees which will consider its proposals, as well as proposals from other interests which affect even remotely the electric railway industry. Behind these representatives will need to be well-qualified committees to give them technical and moral support.

The Unlimited Transfer—Unlimited as to Variety

TRANSFERS present an ever-old yet ever-new problem in electric operation. Although the purpose of all transfers is the same, namely, to require the passengers to make a continuous journey in the same general direction so that he cannot use the transfer as a return ticket or as a stopover to transact business on the way, there is a great difference in the forms of transfer used. For instance, here are some of the methods which have been used, or are being used, to indicate the route to which the passenger is limited in making his trip on the car to which he transfers: A skeleton map or printed list of the lines with the route to which he can transfer punched, a skeleton map or printed list of the routes with the line to which he is not allowed to transfer punched, color of ticket to indicate the general direction combined with printed list of the routes over which the ticket is available.

A still greater variety exists as to the way of indicating the time limit on the ticket. Where there is a time limit there must be some way of marking the ticket as to its expiration for the year, month, day of the month, hour and minute and whether the hour is in the morning or afternoon. Of course, the year and the day of the month do not have to be punched by the conductor. They can be printed on the ticket or punched at the carhouse. Where the day of the month is printed on the transfer, there is a possible greater waste of stock, but large companies can afford this waste to make the day of issue more easily read by the receiving conductor. The device of the p.m. coupon (a comparatively modern idea) pretty well identifies the transfer as to issue before or after noon, but the ways of indicating the hour and the minute are legion. They have been shown by punching the hour and using different colors for the four fifteen-minute periods, by punching both the hour and the minute in a miniature clock dial or in numbers printed on the ticket and by tearing the ticket from a stub which is graduated according to the hours from 1 to 12.

Finally, practice varies as to whether the conductor should punch the time within which the transfer is valid or the time at which the car left its terminus. In the latter case the time during which the transfer is valid is shown by the time punched, plus the number of minutes printed on the front of the transfer opposite the name of each intersecting route.

Many other varieties of transfer have been devised for various purposes, even for trying to indicate the appearance of the receiving passenger, but space will not permit an enumeration of all of them. Enough has been said to show the enormous and probably the unnecessary variety in practice. There is, of course, not the same necessity of standardization in forms of transfer as in other electric railway equipment and methods. As the routes necessarily differ in name in each city, transfers are not interchangeable and have to be printed separately. Hence no great harm is occasioned by having a different arrangement and form of ticket. Nevertheless, it is evident that some forms and arrangements must be better than others, and it would be well for each company to study its own form to determine whether some improvement cannot be made. The mere fact that a transfer has been in use for five years or more without being subject to conspicuous abuse is not a valid reason for its continuance.

Interest and Initiative in Education Must Begin at the Top

THERE is little use in trying to push an educational program on any electric railway property unless the men who direct its affairs have strong convictions regarding the value of post-school training in the industries. The first task, therefore, which confronts the enthusiast who would like to have such a program started is to insure co-operation from headquarters. It may be that the manager will need to be convinced regarding such points as these: First, in its own interest every electric railway should supply special educational facilities to the men in its employ; second, the educational program should provide (1) for better performance of present tasks, (2) for training for promotion and (3) for education along the lines of general good citizenship. The need for special training in industry is urgent, partly because boys drop out of school on the average very young, and partly because nothing has as yet been developed to take the place of the old-fashioned apprentice system.

Provision of an educational program does not mean, necessarily, that a railway should run a school, although that is desirable in some cases. All that it does mean is a co-ordination, for the benefit of employees, of the facilities provided by organized educational agencies, supplemented by such special facilities as are not otherwise available. The awakening interest in vocational education in electric railway circles is a sign that these facts are becoming evident. The efforts of the American Association to stimulate the interest, therefore, ought to be encouraged.

On every electric railway property there should be some one qualified person who is assigned the task and privilege of organizing the educational work. This person can study the individual and group needs and desires of the employees, can advise them as to procedure in meeting these needs, can co-ordinate the local educational agencies in so far as they relate to his own company's needs, and can plan for the special activities which his company should undertake. The work of this man will be fruitful, however, only if the management backs him up.

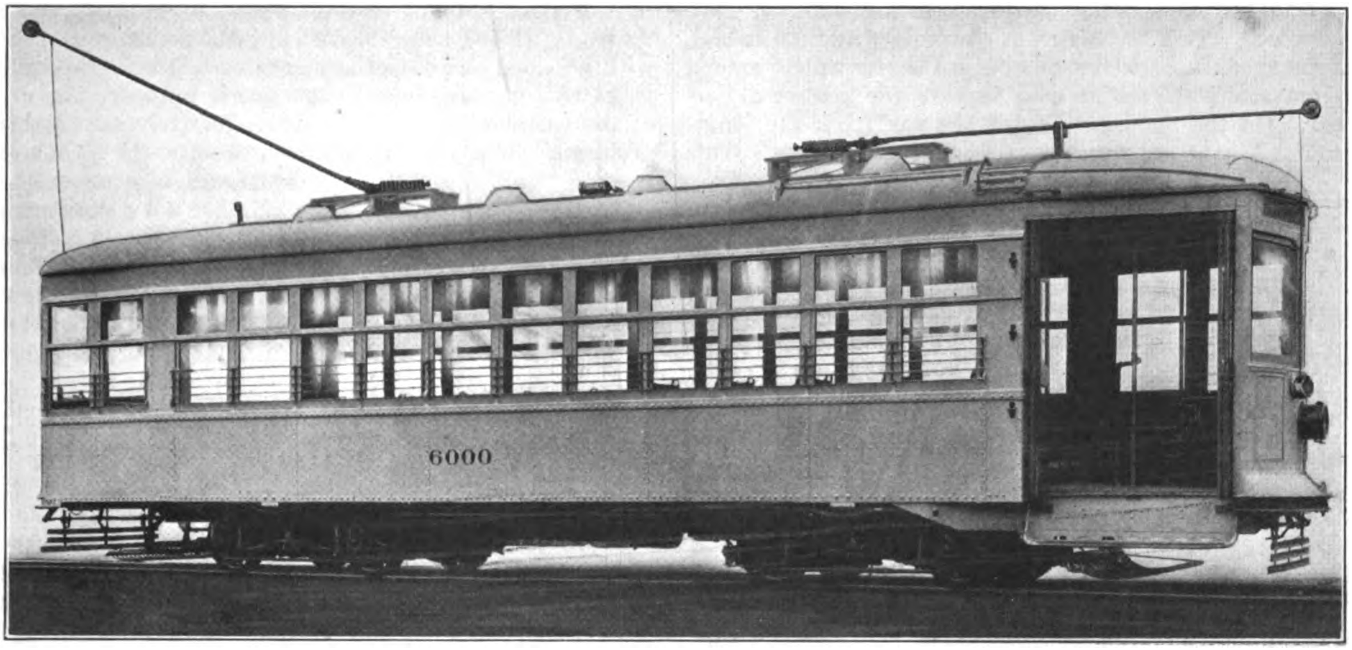
Statistics and Experience as Bases for Decisions

A CHARACTERISTIC of modern methods in electric railroading is the much more extended compilation and use of statistics than ever before. The full benefit is not always had from these statistics because the most important facts are not compiled or full use is not made of those obtained. Nevertheless, it is undoubtedly true that much more time and attention is being given to this matter than formerly, and in recent comments in these columns and in the "Letters to the Editors" in this paper some valuable suggestions have been brought out as to how the real worth of statistics may be measured.

To some of the older men in the business the attention paid to statistics in these days seems hardly worth while. At the same time, although they may not realize it, these older men really use the same process as that which they criticise where they decide a question on the basis of their experience. The only difference is that they keep the facts and figures in their heads rather than on paper.

Another element required to decide a business question correctly, besides experience or statistics, is intuition. This is power to draw conclusions from given facts, and while experience may sometimes be considered to include intuition, it is entirely correct to say that no written statement of facts or clear memory of them minimizes the value in business affairs of good intuition or judgment. This is particularly true in electric railroading on questions which concern persons rather than things. A good example is the matter of promotion in the service. Here statistics mean little, intuition much. On the other hand, there are many engineering questions where with sufficient facts future results can be predicted with absolute certainty. Here no intuition is required.

The conclusion to be reached in this matter is that it is not wise to generalize from very narrow experience and that the more extensive or complicated the facts on which to base a decision, the more important it is that these facts should be in definite—and preferably written—form. A statistician should not be allowed to manage a property unless he has other qualities than those of a statistician. Nevertheless, he can supply data on which a wise manager is able to base a sound judgment. In preparing this information the statisticians do a great deal of the grinding work and leave the manager more free to carry out his duty, which is to interpret these figures and apply them in the solution of problems for which he is responsible.



WIDE DOUBLE-DOOR OPENINGS FACILITATE ENTRANCE AND EXIT

Light-Weight One-Man Cars for Eastern Massachusetts Street Railway

Double-Truck Cars Weighing Less than 16 Tons and with a Seating Capacity of Forty-eight Have Been Placed in Operation—Several New Features

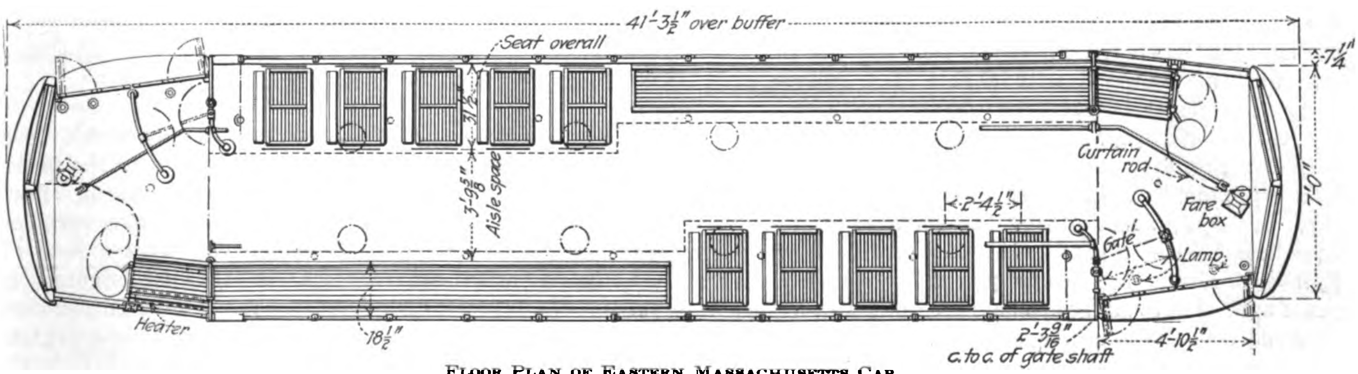
TWENTY-FIVE new light-weight, one-man, double-truck cars have been placed in service recently by the Eastern Massachusetts Street Railway. Completely equipped, these cars weigh 31,883 lb., which is from 12,000 to 16,000 lb. lighter than other double-truck cars which the company has in service. The cars were built by the J. G. Brill Company and have a steel underframe and semi-steel body construction. The underframe and superstructure were evolved from the light-weight Birney safety car type, with provision to meet adequately the larger passenger load requirement. Corner and side posts are of $1\frac{1}{2}$x$1\frac{1}{2}$x$\frac{3}{16}$-in. angles, which are continuous and form the carlines to support the poplar roof. The side sheathing is of $\frac{3}{32}$-in. sheet steel. Dimensions are shown in an accompanying table.

An essential feature of the construction is the use of two extra wide folding doors operated by air so as to provide two passageways, one for entrance and one for exit, thus permitting the simultaneous flow of passengers inward and outward. The door openings are at diagonally opposite corners of the car, and the two-leaf folding doors inclosing these openings swing outward. Stationary steps are used in place of the customary folding type.

All side window upper sash are framed in one piece and the lower sash are arranged to raise 25 in. in clear. The single sash on the left-hand side of the vestibule directly in front of the operator is stationary, while that on the operator's right is arranged to drop.

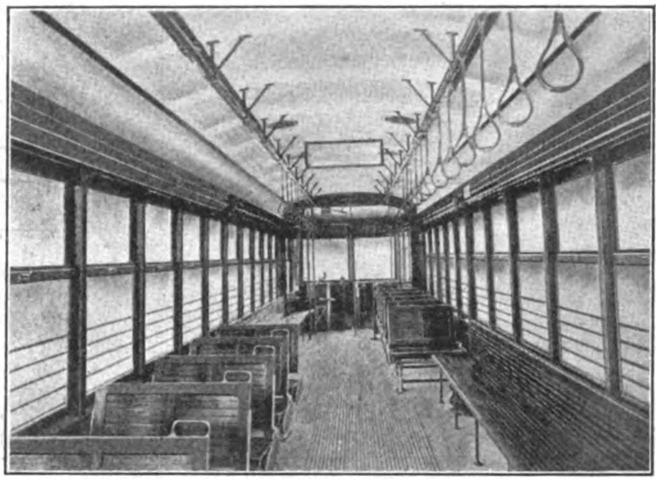
PRINCIPAL DIMENSIONS OF EASTERN MASSACHUSETTS STREET RAILWAY LIGHT-WEIGHT CARS

Length over corner posts	28 ft. $1\frac{1}{2}$ in.
Length over platforms	39 ft. $9\frac{1}{2}$ in.
Length over bumpers	41 ft. $3\frac{1}{2}$ in.
Width over sides	8 ft. $2\frac{11}{16}$ in.
Extreme width	8 ft. $4\frac{5}{16}$ in.
Height rail to side sills	2 ft. $1\frac{13}{16}$ in.
Height rail over trolley board	11 ft. $7\frac{1}{2}$ in.
Height rail to step	15 in.
Height, step to platform	$14\frac{1}{2}$ in.
Seating capacity	48



FLOOR PLAN OF EASTERN MASSACHUSETTS CAR

Another interesting feature is the seating plan adopted. This consists of two longitudinal seats, accommodating twelve passengers each, which extend from the platform at each end to the center of the car. On the opposite side of the car from the longitudinal seats are five two-passenger cross-seats. This seating arrangement provides an aisle throughout the entire length of the car of twice the width which would have been possible if the cars were equipped exclusively with cross-seats. The staggered arrangement of the seating gives uniform loading conditions. While this type of car has a seating capacity of forty-eight passengers, the seating arrangement adopted gives accommodations to a large number of standees. The longitudinal seats extend the length of six windows in the body and one window beyond the corner posts. All seats are of a wooden slat type.



LARGE AISLE SPACE IS A PARTICULAR FEATURE OF THE INTERIOR

Pipe railings are provided at the door openings to direct the passengers and to separate the incoming and outgoing passengers. A sliding curtain is provided which surrounds the motorman in his position at the front left-hand side of the platform. The fare box is mounted just to the operator's right in a position central with the width of the car and at the front end. All electrical wiring is installed in metal conduits and the latest fireproof construction is employed throughout. The cars are provided with safety air brake equipment, as prescribed by the Public Utilities Commission, whereby passengers or the operator may, by applying the emergency cord, shut off power, apply the brakes, sand the rails and instantaneously release both front and rear doors. Weights of the various parts are given in an accompanying table.

The trucks are Brill low-level No. 77-E-1 type, with a 5 ft. 4-in. wheelbase, 26-in. diameter wheels and 3¾x6-in. journals. In motor equipment fifteen cars are equipped with Westinghouse type 508-A motors and ten cars are equipped with G.E. 264-A motors.

Another novel feature for surface car operation is the use of Westinghouse special air brake equipment with variable load compensating device. This variable load equipment is the first ever installed on surface cars, but equipments having the same general features have been in use on the cars of the New York Municipal Railways since they were placed in service several years ago. The braking problem for light-weight cars has received considerable attention. With the light weight on the wheels a low brake cylinder pressure is essential in order that slipping of the wheels may not occur with no load. If the same brake cylinder pressure is used with a loaded car, stopping distances will be excessively long, with increased danger on severe grades. The use of the variable load features has effectively solved this problem. Briefly this equipment limits the pressure passing from the operator's brake valve or from the emergency valve to the brake cylinder to a maximum amount which will not cause wheel sliding. It is thus possible to obtain an 85 per cent braking ratio with the car empty or fully loaded or with some intermediate weight. In operation when less than a full service application is desired, the motorman can make a partial application with his brake valve and then graduate the cylinder pressure to that desired. The variable load apparatus, however, prevents getting into the cylinder any more pressure than the load of the car will justify.

WEIGHTS OF CAR AND EQUIPMENT PARTS

Body, less electric and air equipment	15,583 lb.
Trucks	9,000 lb.
Electrical equipment on body	1,500 lb.
Air equipment on body	1,200 lb.
Motors and gears	4,600 lb.
Total	31,883 lb.

The operation of this equipment can best be followed by referring to an accompanying diagram. As the car comes to a stop, the opening of the doors energizes two magnet valves through a door contactor. The upper one of these magnet valves shown in the diagram exhausts air so as to unlock the pressure limiting valve mechanism, while the lower magnet valve admits air to the strut cylinder. A rocker arm is mounted on the body bolster and the admitting of air to the strut cylinder extends the push rod of this cylinder so as to bring the foot plate of this rocker arm in contact with the truck transom. The other end of the push rod is moved out at the same time corresponding to the load on the car and adjusts the limit valve to its proper position.

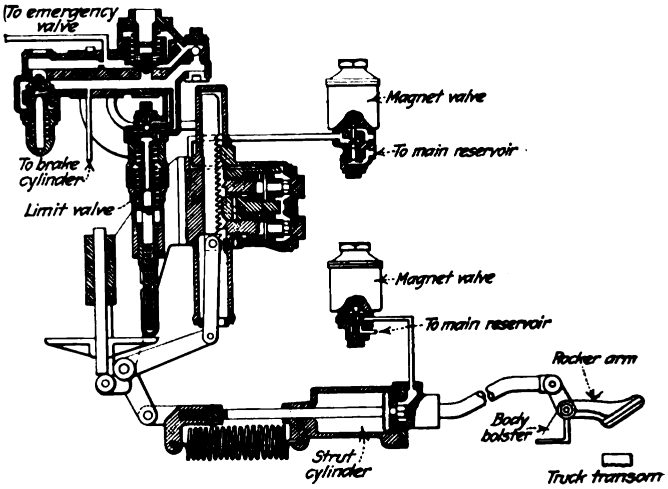


DIAGRAM OF VARIABLE LOAD EQUIPMENT

This limiting valve is in effect an adjustable feed valve and regulates the maximum pressure to the brake cylinder. With a light car 85 per cent braking effort is obtained with approximately 34-lb. brake cylinder pressure, and a completely loaded car with a load of 21,000 lb., which corresponds to 150 passengers, requires 57-lb. brake cylinder pressure to give 85 per cent braking effort. The closing of the doors de-energizes the magnet, locks the limiting valve and exhausts air from the strut cylinder. The strut cylinder spring then pulls the cylinder so as to lift the foot plate from the truck transom, and thus the vibration of the car when it is moving is not transmitted to the variable load apparatus.

All air to the brake cylinder passes through the limiting valve. As this is adjusted at each stop to the load on the car the maximum pressure going to the brake cylinder is proportioned to the load on the car. In other words, it is possible to secure a cylinder pressure that will give 85 per cent braking ratio with a loaded car and yet hold the cylinder pressure for an empty car down to a value that will not cause wheel sliding.

Other features of the equipment provided for these cars include Brill exhaust type ventilators, eight per car, with ceiling register and removable shutter, also Brill vertical-handle, geared type hand brakes and "Dedenda" alarm gongs. Hunter illuminated destination signs are provided, and the sand boxes have Ohio Brass Company's air sanders. The Farraday electric buzzer system is used, and the heaters are Consolidated No. 1522-T. The door engines were furnished by the National Pneumatic Company. Golden Glow headlights, Keystone trolley catchers and Rico No. 7 hand straps are used. A Krantz safety type switch panel is used for the mounting of switches.

Anti-Friction Bearings for Electric Cars

A Review of the Results Obtained from the Use of Anti-Friction Bearings Here and Abroad, Together with a Description of Some of the Principal Types—The Economies Effected and Troubles Experienced Are Given

By Oscar R. Wikander*
Lang-Wikander Engineering Company, New York, N. Y.

ANTI-FRICTION bearings have been applied to the armatures, axles and journal bearings of electric cars in a considerable number of instances. The conditions governing their use for the three different types of bearings are somewhat different, and in the following discussion each will be considered in detail. The use of ball bearings on the armature shafts of railway motors has been advocated by progressive ball bearing manufacturers for several years. Such applications have been tried on a large number of roads with varying degrees of success.

Among the advantages claimed for the use of ball bearings, probably the one which has received the greatest amount of attention, is that of the decrease in starting current, due to the smaller starting friction of ball bearings over plain types. A decrease in the power consumption follows as a direct result. With properly constructed ball bearings, the wear at the bearing should be considerably reduced, and the danger of the armature wearing down in its bearings so as to cause rubbing on the field pole faces is reduced. A reduction in this bearing wear also makes it practical to reduce the air gap of the motors to a considerable extent, which would produce a lighter motor for the same power or a more powerful motor of the same weight.

Another advantage claimed from the use of ball bearings is that, due to the narrow construction at the bearings, it is possible to build the whole motor narrower so that a motor of greater power could be designed for a certain width between the wheels. The use of anti-friction bearings also should produce a considerable saving in the cost of lubrication, since this type of bearing should require lubrication only about every six months instead of weekly, as is the requirement for plain bearings.

While some installations have met with considerable success, others have failed and have caused great inconvenience. Bearings with insufficient load-carrying capacity have been applied, together with improper design of the bearing housing. As a result of this last consideration bearings have been damaged while being mounted or when removed for the purpose of inspection. Other failures have resulted from stray current passing through the bearings, which may be due either to arcing at the brushes in cases of heavy overload on the motors; to a portion of the motor current passing through the housings, bearings and trucks on its way to the rails, or to local current induced in the housings and shafts in the motor. Ball bearings are very sensitive to the influence of electric current, and even a very slight amount passing continuously through a ball bearing will cause pitting and premature destruction.

Another difficulty which has been encountered in the use of anti-friction bearings is that they are subjected to heavy shocks, particularly in the case of old and worn tracks. Ball bearings are quite sensitive to shock loads, due to the fact that their capacity to carry even temporary overloads is not much larger than their continuous load-carrying capacity. While proper selection and mounting may to a considerable extent overcome such failures and while several arrangements have been proposed for overcoming them, still in spite of the great efforts made to design reliable ball bearings for railway motors, the margin of safety obtainable is not quite satisfactory.

SOME ADVANTAGES OF ROLLER BEARINGS

Properly designed roller bearings possess the same advantages as ball bearings in this application and the additional one that they do not appear to be subject to pitting by electric current to anywhere near the same degree as ball bearings. They are, furthermore, capable of sustaining comparatively heavy shock loads. It can conservatively be said that a roller bearing will carry about 60 per cent more load than a ball bearing of the same outside dimensions and stand more than double the shock load. For the above reasons the results obtained with roller bearings in electric railway service have been on the whole far more satisfactory than those obtained with ball bearings. Manufacturers of railway motors in Germany agree that precision roller bearings are by far the best solution of the bearing problem for electric railway motors.

---

*Member American Society of Mechanical Engineers; formerly consulting engineer S.K.F. Industries, Inc.

Roller bearings have seldom been used for electric railway motors in America. The reason for this is that precision roller bearings, as they are termed in Germany, have not as yet been marketed to any large extent in the United States. The term precision roller bearings is applied to those which are manufactured of as high grade material as the best ball bearings, are of equal precision in the workmanship and have about the same coefficient of friction. The commercial roller bearings most widely marketed in America do not measure up to these standards. They have a coefficient of friction which is from two to five times larger than that of high-class ball bearings and do not meet the requirements for railway motor service. Several installations with such bearings have, however, been made in this country. The first one probably was that by the Interstate Consolidated Street Railway at Pawtucket, R. I., about twenty-five years ago. This is referred to again later in the article.

A short description of some of the German designs of roller bearings which have proved most satisfactory may be of interest. The mounting of a Jaeger roller bearing as manufactured by G. & J. Jaeger in Elberfeld, Germany, is shown in Fig. 1. This type of bearing is used to a large extent by the Greater Berlin Street Railway. Cylindrical inner and outer races and cylindrical rollers are used. An important feature of the Jaeger bearing is the very rigid and substantial cage which guides the rollers at both ends, thereby securing a true rolling motion and effectively preventing them from skewing. The bearing on the commutator end is provided with rollers of a very characteristic shape. Projecting from the middle of each roller is a cylindrical flange which is guided between shoulders in the inner as well as in the outer race. The object of these flanges is to carry any thrust loads. The bearing at the pinion end permits the shaft to float longitudinally and adjust itself to any expansion and contraction which may be produced by temperature changes.

Another mounting of these bearings, as used for a split-frame motor, is shown in Fig. 2. According to an article by H. Behr published in *Zeitschrift des Vereines Deutscher Ingenieure*, Vol. 49, 1921, fifty-five motor cars

in Berlin have been in satisfactory operation with Jaeger roller bearings for about seven years. In the year 1921 the Greater Berlin Street Railway equipped 184 motor cars or 368 railway motors with Jaeger roller bearings, and at the time of the writer's visit, nine months later, they were giving satisfactory service.

The "Norma" bearing, which is marketed by the S.K.F. Norma, Riebe-Werke, and others, is designed with cylindrical inner (or outer) race and cylindrical rollers. The outer (or inner) ring is slightly convex in longitudinal section, so as to permit of a slight misalignment of the motor shaft. Fig. 3 shows such a bearing in a mounting, designed by the S.K.F. Norma Company, while Fig. 4 shows an armature bearing mounting, recommended by the Riebe-Werke. An important feature of the Norma roller bearing is that the rollers are guided between flanges in the ring, which has a cylindrical raceway, so as to prevent skewing and secure true rolling.

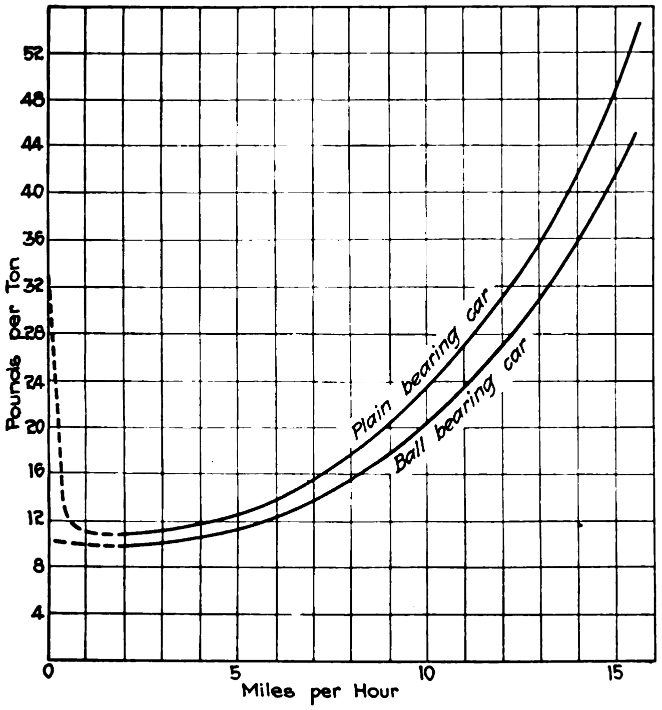

FIG. 8—GRAPHICAL RESULTS OF TESTS OF PLAIN AND BALL BEARINGS

The earlier designs of Norma roller bearings had hollow rollers running on pins, which were riveted to side rings so as to form a substantial cage, but it was found that the lubricant did not always get the proper access to the inside of the rollers, thereby causing hot bearings, and that the hollow rollers were more liable to develop hardening cracks than solid ones. For these reasons the hollow rollers have been abandoned and solid ones adopted. In the designs shown in Figs. 3 and 4 the thrust is taken up by the end surfaces of the rollers at the commutator end.

A mounting used by Kugelfabrik Fischer in Schweinfurt-am-Main, in which a floating barrel bearing is used at the pinion end, is shown in Fig. 5. At the commutator end, which has a much smaller bearing reaction, a deep groove type ball bearing takes the radial and thrust load. The bearing at the pinion end has barrel-shaped rollers, a cylindrical outer race and an inner ring with guiding flanges on both sides of the rollers and a raceway which fits the curved outline of the rollers.

With the exception of the above-mentioned company in Pawtucket, R. I., G. & J. Jaeger & Company in Elberfeld, Germany, is the only firm which to the writer's knowledge has ever attempted to apply anti-friction bearings to the axle suspension of railway motors. The bearings used by the latter firm are, of course, of the Jaeger type, and the main advantage claimed is that when anti-friction bearings are used for the axle suspension as well as on the armature shaft, the center distance of the speed reduction gear will remain constant. It is expected that the life of the pinion and gear will be considerably increased on account of this feature. In addition there are, of course, the advantages of power saving and saving in cost of lubrication and bearing maintenance. This application requires, however, either a split type bearing design or an extremely reliable bearing, because it will be necessary to remove one of the car wheels in order to replace a broken bearing of the single-piece retainer type. In view of the comparatively light load on axle bearings it appears, however, that the application can easily be made perfectly safe.

The application of ball bearings to electric car and steam-road journal boxes has been tried in Germany, Sweden and the United States. These have operated satisfactorily at low speeds and over good track. For higher speeds and with defective track the bearing breakage has become excessive due to the fact already stated that ball bearings are not capable of carrying heavy shock loads. In some cases stray electric currents have also been an additional cause of premature destruction of such bearings.

The most extensive tests of the application of ball bearings to street cars and railroad car journals have probably been carried out by the S.K.F. Company in Sweden and, due to the high grade of material and workmanship used as well as to the engineering skill exercised in the selection and mounting of these bearings, the results were comparatively encouraging. The mounting shown in Fig. 6 was used on fifty ore cars and has been in satisfactory operation for about seven years. The service has, however, been comparatively light and the maximum speed did not exceed 25 m.p.h. The yearly renewals of the bearings did not exceed 2 per cent, which may be considered a very satisfactory figure. Tests were also made by the same firm on ten passenger cars and on ten locomotives. The mounting used for the passenger cars was similar to the one shown in Fig. 6, while the one used for the locomotives was similar to the one shown in Fig. 7.

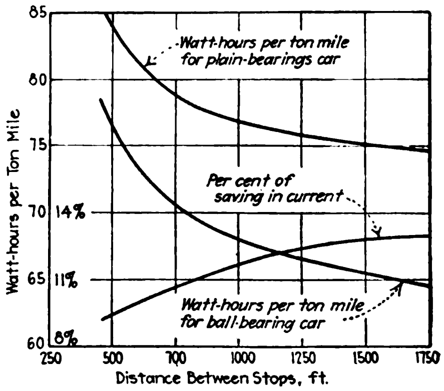

FIG. 9—POWER CONSUMPTION FOR CAR WITH BALL AND PLAIN BEARINGS

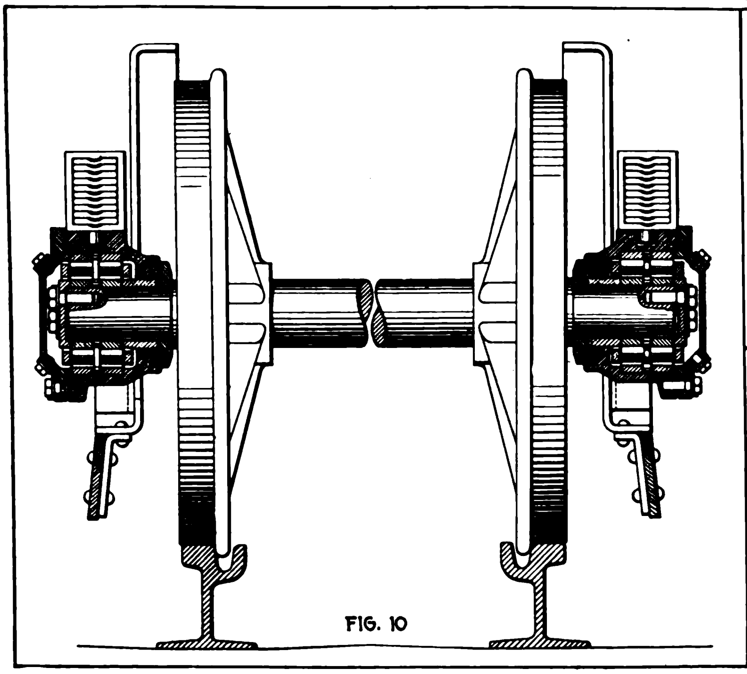
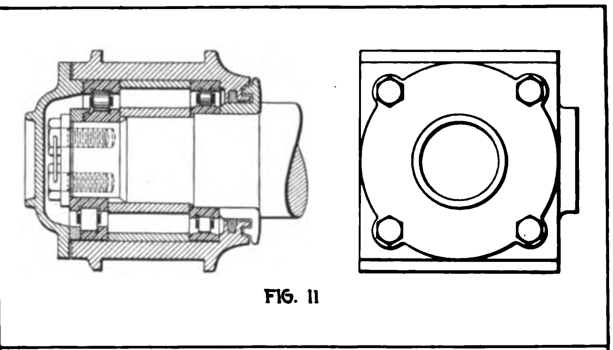
While the results were satisfactory from the point of view of operation, and fuel savings of more than 10 per cent were obtained, the annual replacements, which varied greatly from year to year, are understood to have been rather high. For the latter reason these tests have been abandoned and precision roller bearings





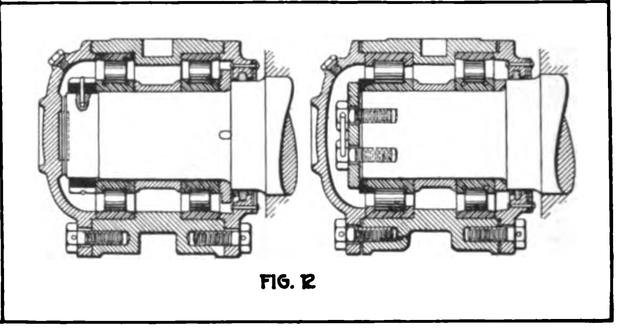


FIG. 10—ROLLER BEARING OF FLANGE TYPE APPLIED TO RAILROAD JOURNAL BEARING BOX. FIG. 11—NORMA BEARING AS APPLIED TO RAILROAD JOURNAL BOX. ALTERNATIVE DESIGNS ARE SHOWN ABOVE AND BELOW THE CENTER LINE OF THE AXLE. FIG. 12—RIEBE-WERKE DESIGN OF TWO BEARINGS MOUNTED IN A JOURNAL BOX

are at the present time being tried on the Swedish State Railways, apparently with success, though so far as the writer knows no details have been published up to the present time.

The operation of the Swedish ore trains showed that the same locomotive could pull thirty-nine loaded ball-bearing cars with greater ease than twenty-nine loaded cars with plain bearings, the fuel consumption being about the same in both cases. The theoretically possible saving in power obtainable in the express train service on the Swedish State Railways, computed on the basis of the following data, amounts to 18.4 per cent.

Distance from Stockholm to Malmö	375 miles
Schedule time for one run	11¼ hours
Number of stops	12
Starting acceleration	0.56 m.p.h.p.s.
Braking retardation	1.56 m.p.h.p.s.
Weight of total train	462 tons

The same train running as a local with sixty stops and thirteen hours schedule time would show a theoretical saving in power of about 17 per cent. The writer understands that the actual saving in fuel in express service amounted to about 13 per cent.

A number of tests of ball bearings in street car journal boxes were made by the Greater Berlin Street Railway and published by Leonard Adler in *Mitteilungen des Vereines Deutscher Strassenbahn und Kleinbahn Verwaltungen* in March, 1917, page 177. The measurements which were made on this installation are less favorable to anti-friction bearings than any other tests which have come under the writer's observation. Here are a few of the results and conclusions:

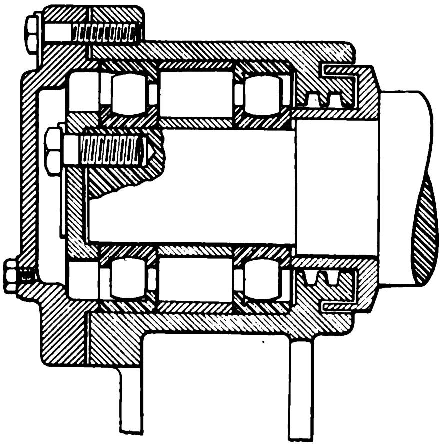

FIG. 13—FISCHER BARREL BEARING MOUNTED IN JOURNAL BOX

It was found that nearly three and one-half times greater drawbar pull (35.4 lb. per ton) was required to start a motor car with plain bearings in the axle journals than one with ball bearings (10.6 lb. per ton). In order to start a trailer with plain bearings a drawbar pull 4.15 times greater (17.3 lb. per ton) was required than when the same car was equipped with ball bearings (4.18 lb. per ton). A motor car fully loaded, weighing 18 tons, was pulled over a level track at different speeds and the corresponding required drawbar pull measured. They are graphically shown in Fig. 8. These curves show a percentage difference in favor of the anti-friction bearings of about 15 per cent up to speed of about 15 m.p.h. For higher speeds the percentage difference would, however, probably be less.

It is frequently supposed that with increasing numbers of stops the greater will be the saving in power resulting from the use of ball bearings in the journal boxes. As a matter of fact the contrary is the case; the longer the runs between stops the greater is the saving in power. The main saving in power is obtained by long stretches of coasting, it being possible to keep the power cut off a much longer time when anti-friction bearings are used. When frequent stops and starts are made a large amount of energy is used for acceleration of the moving mass, and this energy is, of course, the same regardless of the type of bearing. The percentage saving in power is therefore greater for long runs. The graphs in Fig. 9 give the power consumption for the motor car referred to above with ball and plain bearings for different lengths of run. It will be seen that the percentage power saving varies from 8.4 to 12.9 with increasing length of run.

The above data all refer to motor cars with ball bearings in the journal boxes only. If in addition the armature shafts were equipped with anti-friction bearings it is conservative to state that the above savings would be at least from 9.6 to 14.7 per cent, and if the suspension bearings were thus equipped the theoretically computed savings would at least be from 10.8 to 16.5 per cent. The actual percentage savings in power measured as averages of many runs and with different cars were as follows:

Motor car A alone	8.2 per cent saving
Motor car B alone	9.3 per cent saving
Motor car A with trailer	7.2 per cent saving
Motor car B with trailer	8.0 per cent saving
The number of stops per mile were about	6
Average running speed	8 m.p.h.
Acceleration	1.56 m.p.h.p.s.
Braking retardation	2.00 m.p.h.p.s.
Weight of loaded car	18 tons

Fig. 10 shows a Jaeger roller bearing of the flanged type applied to a railroad journal box. Such journal boxes have been installed on a number of German street car systems with success, and a number of cars of the German State Railroads are being so equipped at the present time. Fig. 11 shows the Norma bearing as applied to a railroad journal box. The design shown above the center line is particularly interesting, because it permits the pulling off of the entire housing as soon as the thrusting of the outer bearing is removed and without removing the inner rings of the bearings. About ten cars of the German State Railroads are at the present time being equipped with such bearings.

Fig. 12 shows the Riebe-Werk's design of two Norma type bearings mounted in a journal box, the general arrangement being similar to the preceding one. Fig. 13 shows the Fischer barrel bearings mounted in a railroad journal box. The bearings are both alike, one taking the thrust in one direction, the other in reverse direction.

SOME AMERICAN TEST RESULTS

The earliest experience with anti-friction bearings in electric car journal boxes in the United States must probably be credited to the Interstate Consolidated Street Railway of Pawtucket, R. I., which equipped one of its cars on the line from Pawtucket to Attleboro with roller bearings about twenty-five years ago. Bronze rollers were used, which rolled directly on the ground axles, polished cast-iron bearing sleeves forming the outer race. It is interesting to note that not only the journal boxes but the axle suspension and the armature as well were equipped with roller bearings. The test did not lead to any further use of such bearings in street car service, probably because they proved to be too short lived.

The first bearing built in the United States, which properly may be called a precision roller bearing, was designed by Julius A. Perkins about twenty years ago. Mr. Perkins was probably the first one to recognize the following fundamental conditions for the successful operation of a roller bearing: (1) Use of highest grade steel, properly heat treated and highly finished for rollers and races. (2) Greatest precision in workmanship, the rollers all being ground to the same size within very small tolerance limits. (3) The necessity of a very rigid cage, in which the rollers are positively guided so as to keep their axes permanently in parallel with the axis of the shaft, thereby securing a true rolling motion and avoiding any skewing of the rollers.

An interesting feature of the Perkins bearing is that the ends of the rollers are journaled in small ball bearings which are mounted in the cage. The load is carried by the rollers exclusively and the ball bearings are only subjected to the comparatively small loads which are required to keep the rollers in proper alignment. Fig. 14 illustrates the design of the rollers, their bearings and the cage of a Perkins bearing. The inner race is made of hardened and ground steel and forms a part of the car axle itself. The outer race is made of cast steel hardened and ground and forms a part of the housing, thereby permitting the building of the whole box so narrow that it can be made interchangeable with existing journal boxes with plain bearings, which of course is of enormous importance in order to facilitate the adoption of roller bearings for existing street or railroad cars.

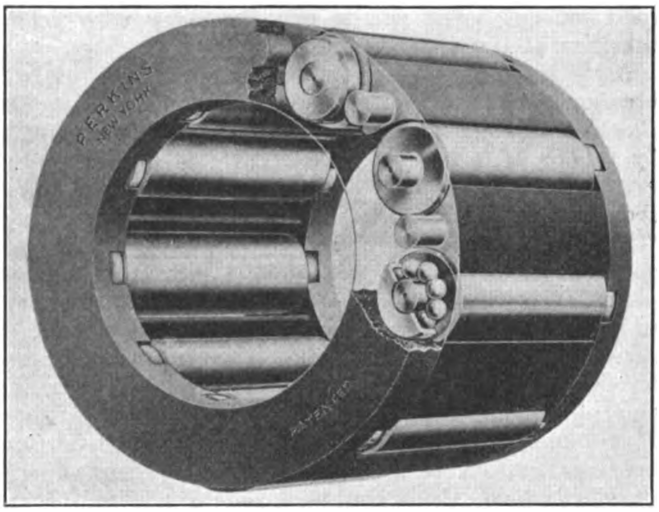

FIG. 14—PERKINS DESIGN OF ROLLER BEARINGS

Fig. 15 is a sectional drawing of a Perkins roller bearing, designed for a Birney safety car. It will be noted that double-acting ball bearings are used to carry the occurring thrust loads. Bearings of this type have been in continuous and successful operation on a number of cars of the Third Avenue Railway of New York City for over ten years.

PENNSYLVANIA RAILROAD TESTS

A most interesting test of ball bearings for railroad journal boxes was carried out by the Pennsylvania Railroad during the years 1913 to 1915. First, one 60-ton all-steel day coach was equipped with ball-bearing journal boxes and gave satisfactory service for several months. Then a complete train consisting of seven cars was so equipped and operated satisfactorily for about fifteen months, after which time the bearings began to deteriorate and were replaced by plain sleeve bearings. It is understood, however, that the railroad company became thoroughly convinced as to the great operating advantages of anti-friction bearings in rail-

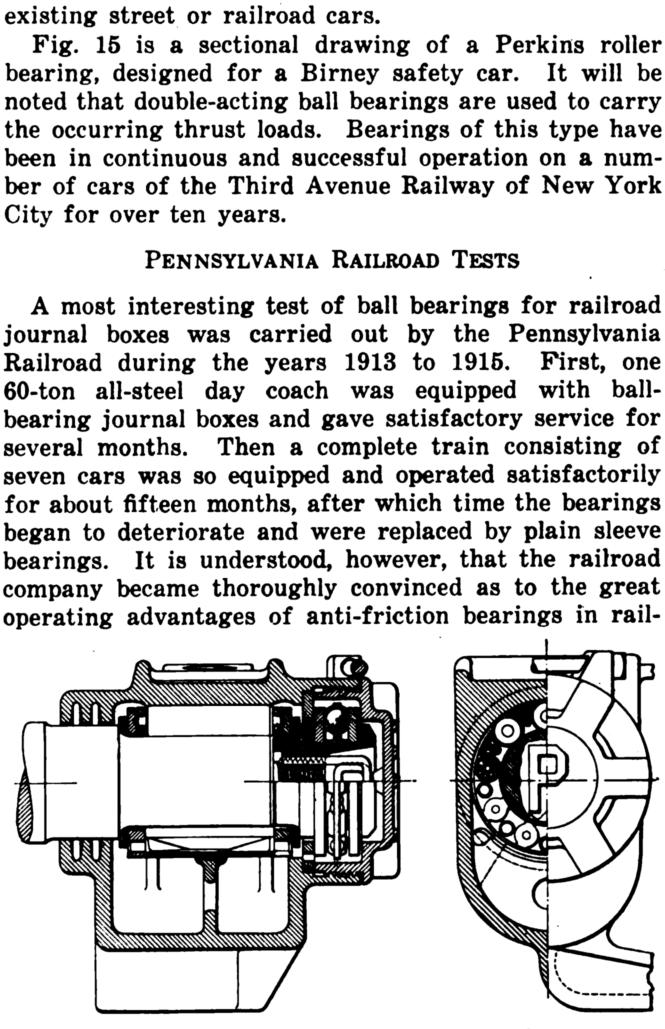

FIG. 15—SECTIONAL VIEW OF PERKINS ROLLER BEARING

road journal boxes and is experimenting with roller bearings at the present time.

A very complete report of an American test of ball bearings in railroad journal boxes was published in the *Electric Railway Journal* of Dec. 25, 1915, page 1263, by Gaylor M. Cameron. The calculated power saving in this installation was 14.9 per cent and actual tests showed a saving of 14.1 per cent.

The actual saving in dollars and cents which can be obtained by the introduction of anti-friction instead of plain bearings varies of course very largely according to the conditions of each case and can, even in specific cases, only be computed roughly on account of the many uncertain factors entering into the problem, the principal one being the life of the anti-friction bearings. If a number of cars are equipped with anti-friction bearings, experience indicates that all of them will by no means have about the same length of life. Some will have to be replaced the first year, some the second and so on. As a rule it is found that the number of necessary replacements is larger during the first two or three years and thereafter decreases. It may further be stated that an average number of replacements of more than 10 per cent is generally considered excessive and this figure may be considered the maximum which will be tolerated.

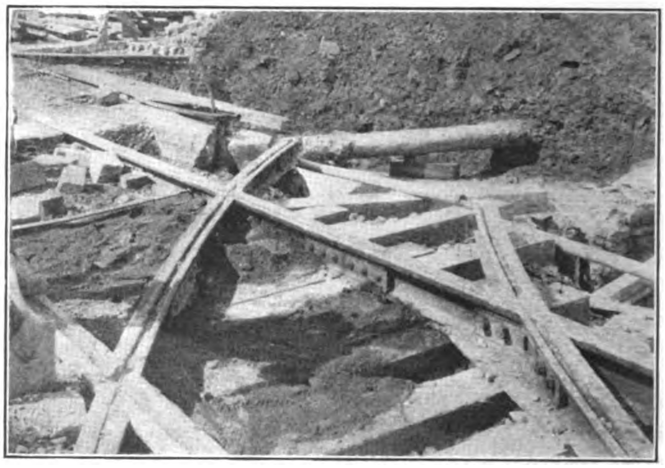
The results of tests with ball bearings on about a dozen other roads which have come under the writer's observation have corroborated that ball bearings do not, on the whole, furnish a sufficient margin of safety for this application. Recent experiences, principally in Germany, have, however, proved that modern precision roller bearings meet the requirements of railway service and the writer dares to prophesy that before very long the railroads of the United States will be equipped with anti-friction bearings to a considerable extent, not so much on account of the saving in cost of power and maintenance, but because the use of such bearings will permit hauling about one-third longer trains with the same locomotive and thus increase the carrying capacity of our railroads to a very large extent for a comparatively small investment.

Emergency Special Trackwork Made in Short Time

By L. R. Brown
Office and Field Engineer New York State Railways, Rochester Lines

RECENT construction work in the city of Rochester demanded that the New York State Railways construct a complete double-track branch-off in less than one week's time in order to maintain car service on three car lines of the city. This branch-off was needed in connection with detour tracks to carry service around a bridge in Main Street which was to be removed. Often in similar cases some old second-hand special trackwork or some new special trackwork held in stock for some other location can be used temporarily for such a purpose, but in this case there was nothing on hand except some second-hand switches and mates. Thus the only thing we could do without holding up the work was to construct the six additional frogs.

A plan was made by the engineering department to a very large scale. For convenience the design was made exactly like another layout in stock which was to be used shortly. The second-hand switches and mates were of the proper radius for use with this layout.



THERE IS GOOD JOINERY ON THIS EMERGENCY JOB

The plans and information were given to Louis Kubiak, the special trackwork foreman, who has charge of the blacksmith repair shop, and he made the required six frogs in four days. To do this he had the six new frogs brought in and bolted up in the shop for a pattern. Guard rails were bent to the proper radius for the curved portion and straight guard rails cut and fitted to form the proper devil strip. Splice bars were bent and used to bolt the rail together as shown in an accompanying illustration. Large ½-in. steel plates were placed under each frog point and the bases of the rails were electrically welded to these plates when the whole was in proper alignment. The grooves across the head of the curved rail was then ground out to permit the passage of the flanges on the straight track and the bottom of the grooves on both the straight and curved rail was filled in with manganese weld to provide flange bearing over the frog points. The frogs were then cut apart to facilitate handling and the job was all completed in less than one week.

The alignment was nearly perfect, and there have been no derailments on the branch-off up to the present time. The illustrations show the appearance of this work. The cost of the six frogs was less than one new manufacturer's frog and the time of delivery shorter by the same ratio. This branch-off will probably not see six months service, but we have had similar home made frogs in use over five years.

H. A. Abell, engineer of way and structures, Rochester lines, New York State Railways, was in charge of this work.

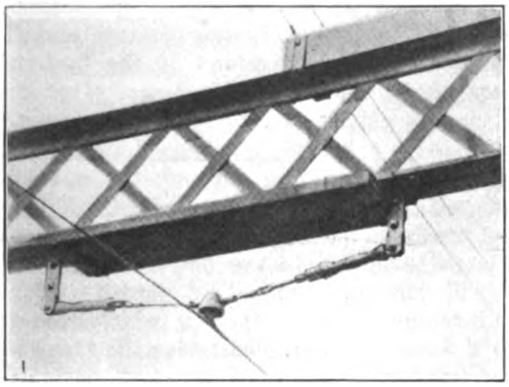
DOUBLE-TRACK BRANCH-OFF CONSTRUCTED WITHIN WEEK IN ROCHESTER, N. Y.

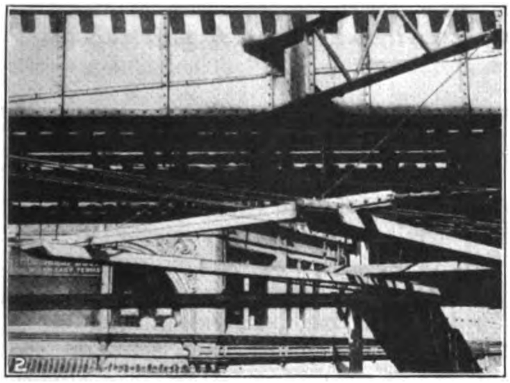
Some Practical Experience with Troughwork Construction

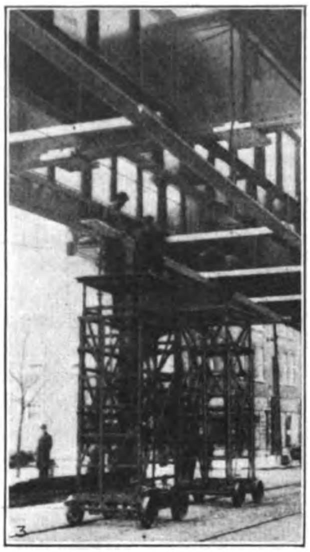
The Protecting of Metal Construction so as to Safeguard the Trolley Wire and Connections from Being Grounded Often Becomes a Serious Problem for the Line Engineer

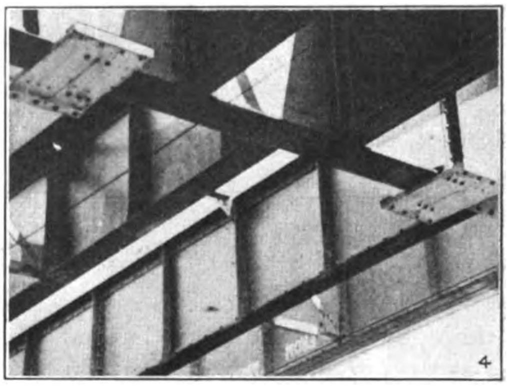
By G. H. McKelway
Engineer of Distribution Brooklyn (N. Y.) Rapid Transit Company

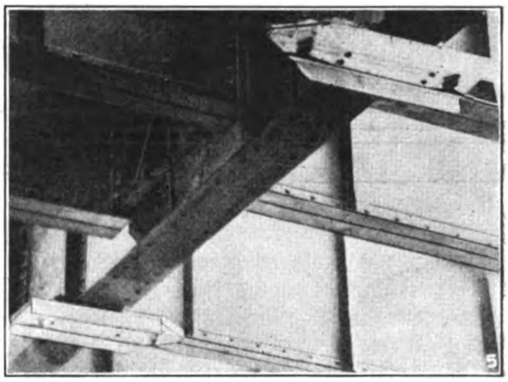
SOME form of sheathing or trough construction is quite necessary at locations where there is metal work through which the trolley wire could be short-circuited by a wild trolley pole. Such accidents occur most frequently at bridges and elevated structures and in carhouses. The positions that a trolley pole can assume and the points that it can reach are frequently quite unbelievable. A straight pole will ground to metal work within a considerable radius and a bent pole will reach almost impossible positions. The second pole of a two-pole car is another fruitful source of trouble, as this pole is sometimes raised either by accident or design while the other pole is still on the trolley wire. Exposed metal is not the only kind of construction that requires protection, as severe grounds have occurred when live trolley poles came in contact with reinforced concrete. The reinforcing rods often form very good conductors, even though they are covered with a layer of concrete.











PROTECTIVE COVERINGS FOR OVERHEAD WORK
No. 1. Wooden sheathing under girder.
No. 2. Long trough construction.
No. 3. Putting up long troughs in place of flashboards.
No. 4. Flashboard construction.
No. 5. Short troughs.

Where the metal pieces to be protected are few usually the best plan will be to sheath them with wood. This construction not only provides the greatest protection, but also is as cheap as or cheaper than a type of construction employing troughwork. When installing this sheathing care should be used to make certain that the straps used to bind the sheathing to the metal work do not touch the grounded metal. Otherwise it is quite evident that a dangerous condition will still exist, for there is a possibility of the pole striking the straps and causing a ground through them.

Where the metal to be protected is quite extensive, it will be best to use troughwork or some similar form of construction. The form adopted will be influenced to a large extent by the height of the trolley wire and the height and arrangement of the metal work. With low iron work requiring the carrying of a trolley wire at a low level and where the metal work is practically continuous, as with girders parallel to the trolley wire, or where there is a bridge floor above the wire, long troughwork should be used.

The long trough construction usually consists of one or two bottom boards with wooden sidings extending down each side of the bottom. The number, width and thickness of the bottom boards will vary with different railways. The thickness usually runs from 1 to 2 in., but a single 1-in. board will usually be found pretty thin, especially where the trough is installed in locations subject to the weather or where the distance between supports is quite long. If it is installed in carhouses, the distance between supports can be lengthened over that used outside. For outside work, the thickness should be at least 1½ in. and preferably 2 in. The width of the bottom trough should be sufficient to permit installation of the ears without the necessity for removing the siding. Some companies get along with a comparatively narrow bottom board by using short ears 9 or 10 in. in length. This enables a single board to be used of not more than 12 in. in width. Where the ordinary 15-in. ear is used the board will have to be at least 16 in. wide. Single boards of that width are quite expensive and this has led to the use of two narrower boards. When two boards are used their total width should be greater than that necessary with a single board, as the hangers should be placed slightly off center, so that any water which may leak through the cracks between the boards will not cause grounds. Water carries dust and dirt from the top of the trough and hangers of high insulating quality are an advantage.

LONG LEAF YELLOW PINE FAVORED

The kind of wood to be used is another variable, but long leaf yellow pine appears to be better than most other varieties. Oak is sometimes used, but it is not only more expensive but does not seem to weather as well as pine and warps more easily. The length of the pieces will be influenced by the price and the ease with which they can be handled. Twelve feet is a good minimum, and a better length is 16 ft. Boards longer than that will be found too costly.

The sidings should be of the same kind of wood and approximately of the same length as the bottom boards, but need not be as thick. One inch is a good thickness for the side boards. The width of the siding should be such that its bottom edge will extend down to a point slightly below the bottom of the trolley wire, otherwise there will be danger of the pole grounding on some vertical column or a low horizontal beam.

In nailing the siding to the bottom board it is best to use copper clad nails, as trouble has been experienced in some cases from the rusting of nails at points where the crack between the bottom board and the siding allowed water to run down on them.

Where the ends of the trough are left square and without protection they soon become battered out of shape by the striking of wild poles against the end grain of the wood. A satisfactory type of construction is to cut the ends back so as to form a V. With this construction the poles that hit on either side of the center of the V glance off. To prevent damage from poles striking fairly on the point, the ends should be guarded by the use of angle irons bent as shown in one of the accompanying illustrations. The use of two pieces of angle iron fastened to the end, one on each side of the point, is not a satisfactory construction, as there is a chance of the pole striking just where the two pieces of iron meet, which would force them apart. The leaving ends of the trough are not armored ordinarily where installation is on a double-track line, but the ends should be reinforced with strips of wood running across the ends of the bottom boards. The ends of the sidings are not usually strengthened, but it is well to cut them back as shown in the accompanying illustration. This prevents a glancing pole from catching between the bottom and the siding so as to pry them apart.

Where the trough is supported from transverse girders crossing just above it and with no clearance between them, it may be attached to the girders by buttons. These buttons are made of oak notched out so as to fit over the flange of the girder. Two of them are used at each girder, one on each side, the trough being bolted to the buttons which rest on top of it. In locations where the girders are too far above the line of the trough to permit fastening with buttons or where intermediate supports are needed between girders, a satisfactory type of construction is to fasten the trough directly to the blocks or crossbeams, which are in turn supported by iron hangers attached to the structure above. At one time it was common practice where the trough was suspended from longitudinal girders to place beams on the lower flanges of these girders and suspend the hanger irons from them. With this type of construction it was found that a wild pole would sometimes strike these crossbeams and knock them out of place, so that the trough would sag. This can be prevented by having the hangers themselves clamp the flanges of the steel. Where there are two tracks it is best to join the troughs by the wooden beams, as this provides a stiffer construction than with the troughs hung separately. Where the hangers are very long still more stiffness can be obtained by having braces which run down to the center of the beams, turnbuckles being cut into these braces for tightening.

For connecting the various sections of the bottom board splices are used. These usually consist of short pieces of wood, but sometimes iron plates are an advantage. These plates are bolted onto the top of the trough, half of the bolts passing through the end of one board and half through the next. In installing these bolts they are installed from underneath and are pushed up through the holes in the bottom board, so that the nuts will come on top. This permits their being tightened readily with a wrench, which would not be possible if they were installed under the trough. While the iron plates make a neater and perhaps stronger splice than wood, yet there is the objection that they may be made alive by trolley wheels touching both the wire and one of the bolts at the same time.

SHORT TROUGH CONSTRUCTION

The construction used for making short troughs is the same as that for the long, but instead of being continuous for long distances and extending all the way from one cross girder to the next they are usually but 5 or 6 ft. in length and give protection only to the cross girders to which they are buttoned. The trolley wire hangs free between the short troughs and thus the troughs make a succession of hard spots in the line which is flexible between them. The short trough construction thus is not as satisfactory as that of the long trough, but it is much cheaper.

Where the girders are all high above the level of the trolley wire it can be supported from spans in the usual manner, and the girders can then be protected by flashboards buttoned on to their lower flanges. These flashboards are merely forms of wooden protection about as long as a short trough. They are usually made of three boards placed side by side so as to give the required width, the boards being held together by wooden crosscleats at the ends.

As a protection against the weather the trough should be painted and two coats of paint should be applied, one of these before the various pieces are assembled. This will permit all sides of every piece to receive a coat of paint, and after the trough has been erected a final coat should be given. To make sure that all of the lumber receives both coats of paint it is well to use paint of different colors for the two coats. A satisfactory method is to use white lead for the first coat and a color that will harmonize for the second.

Equipment and Its Maintenance

Short Descriptions and Details of New Apparatus of Interest to the Industry. Mechanical and Electrical Practices of All Departments

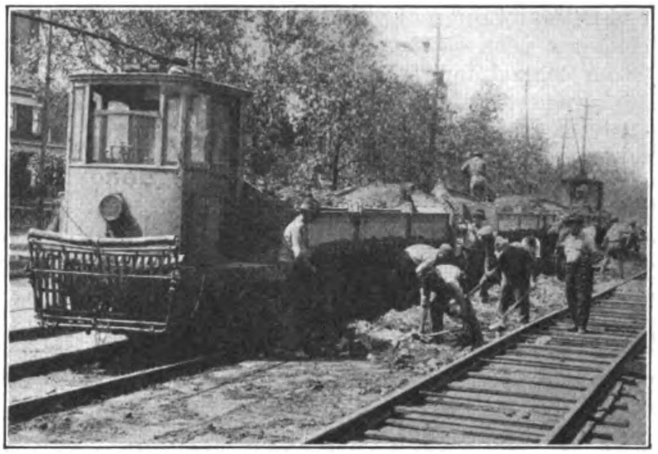
Use of Dump Cars in Cleveland, Toledo and Pittsburgh

Double-End Control of Three-Car Trains Is Provided by Having a Single-Cab Four-Motor Car at Each End with a Trailer in the Middle

THE electric railway has a greater variety of repair work to do than any other public utility, and in most cases this must be carried on with a minimum of interruptions to the regular service. Consequently all available means are utilized to get the required results without subjecting passengers to annoying delays in reaching their destinations, or causing other delays in service.

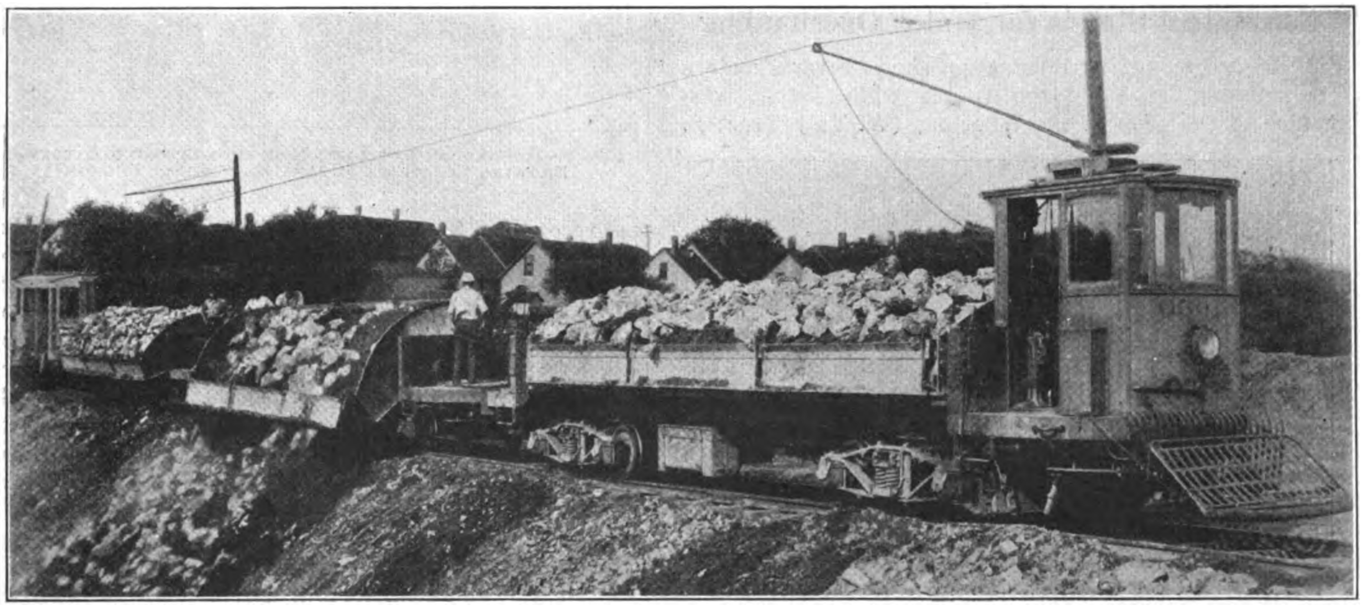
To assist in making rapid repairs a large number of railways have been adding to their repair equipment dump cars having several new design features that have advantages in reducing the number of delays in traffic, where repair work is in progress. Generally, most of the delays are a result of a carload of sand, gravel, or other repair material along the right-of-way, being unloaded by hand where no side track is available, which of course results in a tie up.

Accompanying illustrations show some of the uses which the Cleveland Railways is finding for Differential dump cars. Some recent equipments were put into service about the first of September and have been operating with entire success. This company has been using such cars for years, both for repair work and extensions on its lines. Originally the company used the cars in trains consisting of one four-motor equipment, with Westinghouse Type HL multiple-unit control, and two trailers, each with two motors. This gave them a train with a cab and master controller on one end only. Later it was found that at less expense the company could secure smoother operation and double-end control by putting a single-cab, four-motor equipment at each end and a trailer with no motors in the middle. Bus line connections between the two end cars permitted the train to be operated from either master controller in different directions, power being furnished through either or both trolleys. At the present time the Cleveland Railways has eight dump cars with quadruple equipments of Westinghouse Nos. 340 and 532-A motors and HL control and seven trailers.



Picking up a Load While Tracks Are Being Reconstructed

A train of this kind can easily be run in between cars operating on a five-minute headway, drop all or any part of its load where desired, and move on out



Side Dump Is of Advantage for Filling in of the way before the following car can catch up with it. Another use the company has made of its trains is for hauling ties. By dropping down or removing the car sides and piling the ties in crosswise, as is done on a flat car, a very satisfactory method of transportation is obtained. To be sure ties are not as easily dumped as gravel, but if the whole load is to be dropped at one place, the body can be tilted and most of the ties will slide clear of the car. The others can be handled very easily from this position as one end is already down near the ground.

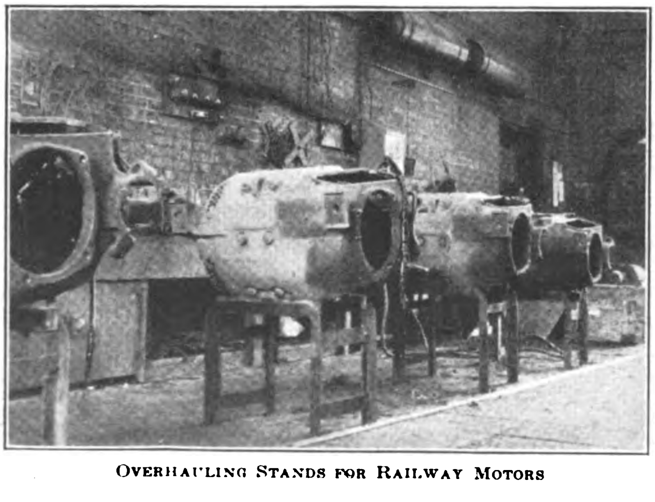
In the winter some of the motor cars are converted into snow plows by the addition of a plow and side boards, and serve to keep the snow over near the curb. It is a common sight on some of Cleveland's main streets, after a heavy snow storm, to see so many automobiles using the railway tracks, which have been well cleared of snow, that the street cars are nearly crowded out.

The Pittsburgh Railways has lately added two double-end Differential type cars to its rolling stock. These are equipped with quadruple equipments of Westinghouse 532-A control and "K" controllers and are mounted on 26-in. wheels. This company has a great quantity of contract work to carry on besides its regular repair work, and it finds this type of car very useful in moving slag and ore or even for carrying away rubbish. Two Differentials are used continually in disposing of ashes from the boilers at the plants of the Duquesne Light Company.

The Community Traction Company of Toledo, Ohio, is another that has recently acquired some "dump" trains for track repair and general hauling. The equipment consists of a three-car train of one motor car and two trailers. The motor car is equipped with four Westinghouse 548-C motors and HL control. The total motor capacity is 400 hp., but the car has been geared so that when loaded to a total weight of approximately 100,000 lb. it will operate and exert the same tractive effort as a 50-ton locomotive. In this manner it is capable of handling six or seven loaded cars in addition to the three cars in the regular train. The Community Traction Company uses the cars for switching around the yards, in addition to the regular track repair and dump service.

Convenient Stands for Motor Overhauling

THE accompanying illustration shows several motors mounted on angle-iron stands while being overhauled in the shop of the Wheeling (W. Va.) Traction Company. These stands are made of 1½-in. x 1½-in. angle irons bent to a U shape and fastened together by 2-in. x ¼-in. iron straps at each end. In order to provide additional support for the motors, the angle part at the top is filled in with wooden blocks. These are cut out to give clearance for projections on the motor frame, and their use is also of added advantage, as it is found that the motor frames are less liable to slip on the wood surface. By the use of these stands the motors are brought to a convenient height for overhauling, so that the work can be done more rapidly and efficiently.



OVERHAULING STANDS FOR RAILWAY MOTORS

Quick Installation of Noiseless Crossings in Cleveland

Old Intersections Were Cut Out and New Ones Put in Place and Connected up in Each Case Between 2 a.m. and Daylight—Near-by Residents Much Pleased with the Result

THE Cleveland Railway has been receiving favorable comment from residents and storekeepers in two neighborhoods where Balkwill articulated crossings were installed recently at street intersections. These intersections were East 105th Street and Euclid Avenue, and Harvard Avenue, S.E., and Broadway. It was recognized by the railway company that while the noise caused by electric railway cars passing over intersections cannot be eliminated in many cases it can be reduced. The difficulty is greatest where the crossing angle is practically 90 deg. The articulated crossings have overcome the difficulty at these two points, where the crossings are both double track. The work in each case was done between 2 a.m. and daylight, the old crossing being cut out by means of acetylene torches. It was done under direction of C. H. Clark, engineer of maintenance of way Cleveland Railway.

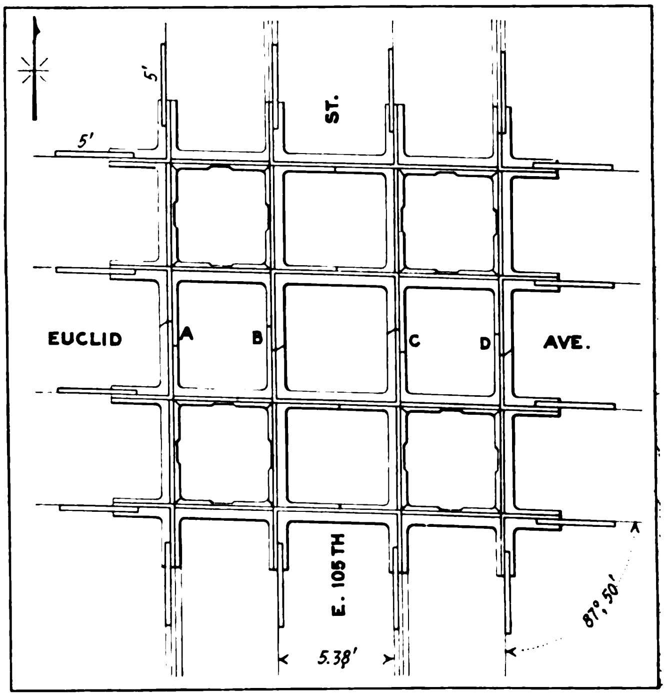


FIG. 1—DETAILS OF CLEVELAND NOISELESS CROSSING LAYOUT, SHOWING LOCATIONS OF DEVILSTRIP SCARF JOINTS

The Balkwill articulated crossing, of which noiselessness is but one feature, is appropriately named because it is made up of a number of castings bolted together to form a rigid structure. The pieces are manganese

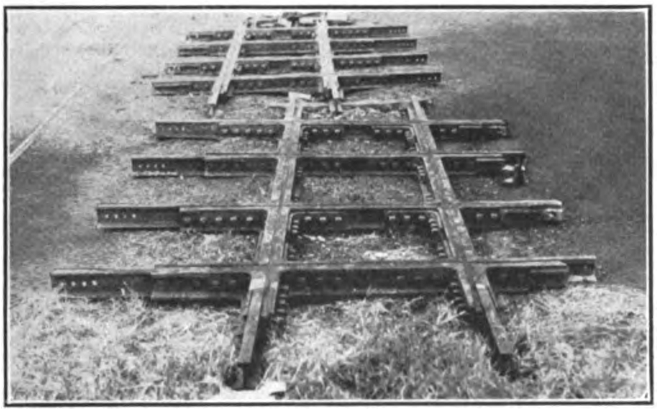

FIG. 2—CLEVELAND NOISELESS CROSSING IN TWO PIECES READY FOR INSTALLATION

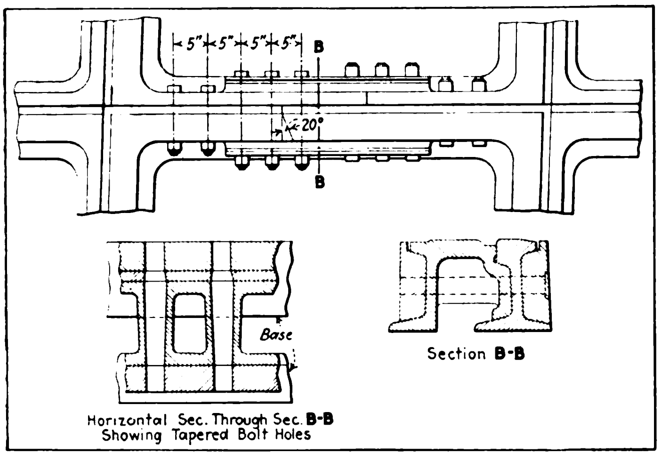
steel castings and they are assembled with 1¼-in. bolts in the Cleveland job, with castellated cube nuts, spring nut locks and cotter pins. The make-up of the Cleveland crossing is as shown in Fig. 1. It is composed of four single crossings of the sixty-four-bolt type, there being ten bolts in each outside angle and three in each inside one. Fig. 1, examined in connection with the reproduced picture of the crossing in halves, shows not only the method of assembly but also the cuts made to facilitate handling. These cuts are designated "A, B, C, and D," and through the tread they are made at an angle of 20 deg. to minimize their effect on wearing quality. The four cuts shown are the only ones intersecting the tread. Fig. 2 gives details of joints A, B, C and D.

The Balkwill construction is designed primarily to provide a crossing of great durability, with elimination of possibility of breakage in the flangeway. The crossing is the flange-bearing type, the groove being but ⅜ in. deep through the intersection when new. The flangeway floor begins to rise at 15 in. to 20 in. from the intersection, gradually approaching the crest as mentioned. Thus the car wheels go through the special trackwork with wheel treads clear of the rail tread.

The Cleveland crossings were made by William Wharton, Jr., & Company, Inc., one of the score or more of special trackwork manufacturers licensed under the patents of Stephen Balkwill of Cleveland. Mr. Balkwill's crossing inventions were described and illustrated in issues of this paper for Jan. 26, 1918, page 192, and July 6, 1918, page 19, where more detail of purpose and design will be found.

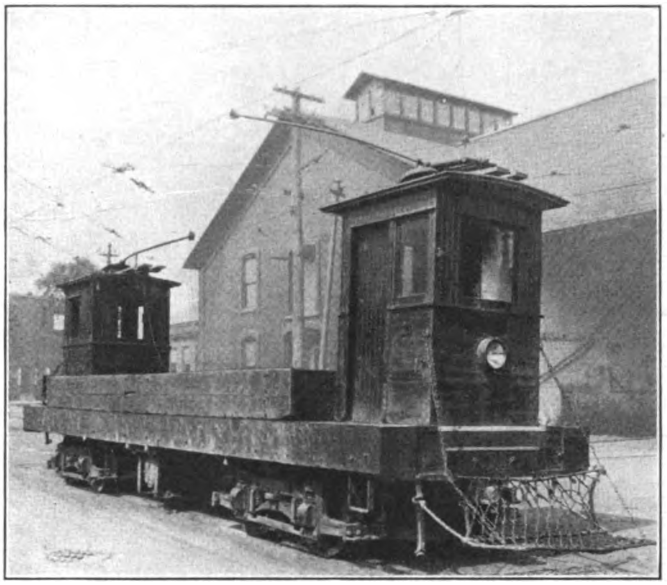


DETAILS OF DEVILSTRIP SCARF JOINT IN CLEVELAND NOISELESS CROSSING

Service Car Constructed from Old Passenger Car

THE Trenton & Mercer County Traction Company has recently built in its shops a service car of the type shown in the accompanying illustration using the underframe of an old passenger car. The sides of the underframe, which were originally 8 in. wide, were reinforced with steel plates ½ in. x 12 in. The steel plate thus projected 4 in. above the wooden sills. These were tied together at the ends and in the middle with steel plates 1 in. x 4 in., and cross-members were also installed of the same dimensions. A false floor was then laid over this of 1½ in. flooring and this was covered with ⅛ in. sheet steel. An operating cab 5 ft. square was constructed at either end, and equipment was installed for double-end operation. Air brakes were added.

Removable sides were constructed for carrying ballast, rail and light material. These sides are constructed in two sections, with three stakes to a section. The stakes set in pockets in the floor of the car and the sides are 18 in. high. The car is 30 ft. long and 8 ft. wide and has a capacity of 20 tons of ballast.



SERVICE CAR BUILT IN TRENTON SHOP

This is the second car of this class which has been constructed in the shops of the Trenton & Mercer County Traction Company, and provision has been made to use these for snow removal during the winter season. Snow noses 58 in. deep have been constructed of planks 10 in. wide x 2½ in. thick and with a ⅛ in. steel plate on the outside. These have a steel nose at the point and are held together by two braces at the back made of 1-in. x 5-in. iron. A hood made of ⅞-in. wood tongued and grooved covers the top of the nose.

For fastening this nose in position on the ends of the car two T-rails are used. These extend 12 in. above the floor of the car and down to within 9 in. of the rail. The cross-braces of the noses have two cleats with a lip which fits over the bottom part of the rail. Thus the snow noses will slide up and down with the rail as a guide. A 6-in. x 12-in. brake cylinder has been installed on each end of the car for raising the snow noses. Air is admitted to this cylinder through a brake valve installed in the cab. When the snow nose has been raised to its proper position, it is held by chains, the upper part of the rails being slotted so that a link of the chain will just fit in the slot. The lower ends of the chains have hooks, which are hooked about the bottom braces of the snow nose on the inside. A similar equipment is provided for each end of the car.

Short Versus Long Contact Tips for Brush-Holders

By J. S. Dean
Renewal Parts Engineer,
Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa.

A FAMILIAR type of contact tip used on the brush-holders of a large number of the older type of railway motors is shown on the left-hand finger of the brush-holder in the accompanying illustration. These are made of either a copper drop forging or machined from a strip of extruded brass metal. As it is the common practice to use carbon brushes in railway service without pig tails or shunts, the question of the wearing action of this tip on the top of the unprotected carbon has often been raised by operators, and it seems to be the general consensus of opinion that it is good practice to make the ears on these tips as long as practicable to increase the contact area, the idea being that this will minimize the wear on top of the carbon at this point.

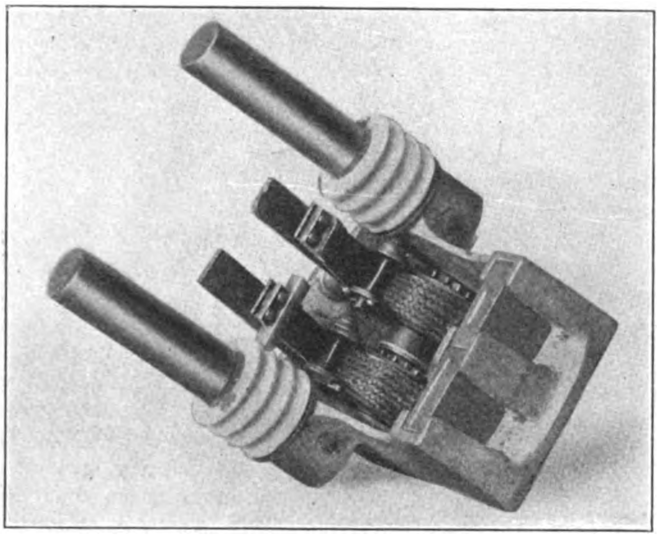


Exhibit Showing Wear of Carbon Brushes with Standard Tip on Left and Tip with Ears Sawed Off on Right

It has been noted that in the operation of brush-holders with these long ears on the contact tips there is a possible chance, after parts of the moving mechanism become worn in service, of a faulty operation of the brush-holder, resulting in a reduction of spring pressure on top of the carbon due to the following reasons:

1. Ears on contact tips riding on top of carbon box.
2. Ears on contact tips riding on top of both carbons; in the case of brush-holders using more than one carbon in the same box.
3. Tendency for the ears on contact tips to jam against the inside of the carbon box as the brush wears down in service.

In addition to the tendency to lose the effective spring pressure, there is always a large percentage of carbons that have the tops broken out due to this type of contact tip.

To secure some information on this subject, a sample brush-holder using two carbons was made up with the tip on the left-hand finger standard, and the tip on the right-hand finger having the ears cut off flush with the sides of the finger, as shown in the picture. The construction of all other parts of the brush-holder pressure fingers was in every other respect identical. With the spring pressure on both fingers of this brush-holder set at approximately 6 lb. and fitted with two new carbons of the same grade, it was mounted in a motor operating in regular service, and after about three months of continuous service it was removed with its carbons and photographed as shown in the illustration. Measurements taken on both test carbons showed practically the same wearing depth on top of carbons and the same end wear.

A second test was made with a similar brush-holder on a different type of motor and the results obtained were the same as outlined above, which indicates that the extensions or ears on the contact tips do not reduce the wear on the top of carbons.

In view of the above findings, the following reasons might be advanced as a possible explanation of results obtained:

1. The wear on the top of the carbon may be due largely to burning action rather than mechanical wear.
2. The long tip is subject to more vibration with more arcing, hence more total wear.
3. The shorter tip has more direct pressure, thus less vibration and less total wear.
4. The shorter tip has greater pressure per unit, hence less arcing and total wear.

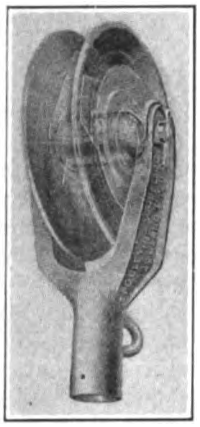
Severe Service Test for Welded Drawbridge Axle

IN THE AUG. 7, 1920, issue of *Electric Railway Journal* a description was given of the making of a thermit weld on a 6-in. diameter pinion shaft used for turning a large drawbridge in North Chelsea, Mass. Cars of the Eastern Massachusetts Street Railway are operated across this bridge and any long delay would mean a serious suspension of operation.

The accompanying illustration shows this shaft, which has broken again after two and one-half years service. The break, however, was at a location considerably outside the previous weld which is shown in the illustration. An idea of the service test to which the weld has been subjected may be gained from the fact that the starting torque transmitted through this pinion shaft is 520,000 lb.

Shaft Broken Outside of Previous Weld

What's New from the Manufacturers



Side Bearing Trolley Wheel

THE accompanying illustration shows a new type of trolley wheel, which is being marketed by the Thornton Trolley Wheel Company, Inc., Ashland, Ky. Among the new features incorporated are side bearings and a grease lubricating system which is designed for service over an extended period without attention. A large contact spring is provided on either side of the wheel for conducting the current, and a large grease reservoir with a hole for filling forms the outside portion.

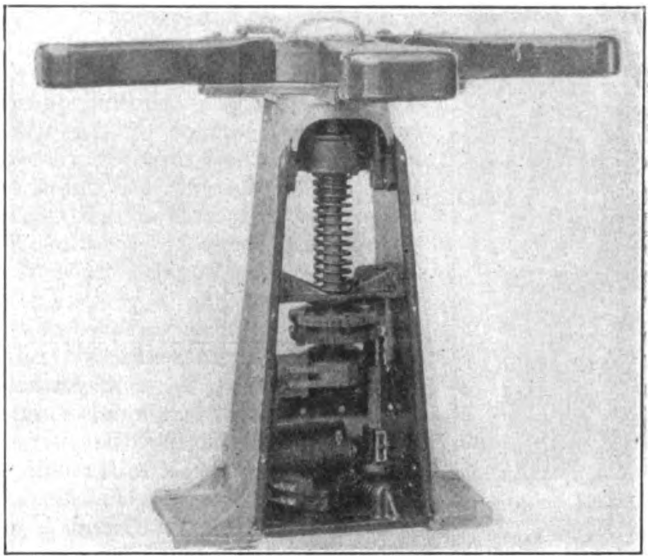
New York Subway Turnstile on the Market

ONE of the features of the General Electric Company's exhibit at the recent American Electric Railway Association convention at Chicago was the new electrically operated turnstile developed for the Interborough Rapid Transit Company of New York City. The General Electric Company is now marketing this turnstile and 430 are being installed in the New York subway.

The complete equipment consists of two elements, the turnstile and the fare box. The latter is mounted near the guide rail to the right of the turnstile and contains electrical contacts, which, when closed by the dropping of the passenger's nickel, permit the turning of the stile enough to admit one person only and lock it in the reverse direction. The stile is, however, designed for free operation in the other direction, so as to permit the free egress of passengers.

On the shaft of the turnstile is mounted a double ratchet wheel with two pawls and below it a cylinder carrying four contact-making plates 90 deg. apart. One of the pawls controls the operation of the stile in the entrance, and the other in the exit direction. The pawls are mounted on a short common shaft, to which is attached the armature of a magnet coil supplied with current from contacts in the fare box.

When the stile is ready for operation one of the contact plates on the cylinder is under the fingers that complete the circuit to the relay coil of the fare box. The pawl which holds the stile from turning in the entrance direction is engaged with its ratchet, the other is free. When a nickel is dropped in the fare box it lands between two contacts, completing the circuit to the relay coil. The energizing of the relay completes the circuit of the magnet coil and its armature turns the shaft carrying the pawls enough to disengage the entrance direction pawl, leaving the stile free to operate in that direction when pushed by the incoming passenger, and to engage the exit pawl, locking the stile in that direction. When the stile has been rotated through 90 deg. by the incoming passenger the relay circuit is broken by the moving of the current carrying plates from under the fingers, the magnet armature is released and the pawls return to their original positions. The relay coil in the fare box actuates a small lever that knocks the nickel away from between the contacts into the chute to the receiving box, thus breaking the contact in the box. Should a dime or a cent be dropped in the fare box by mistake, their smaller diameter permits them to drop free between the contacts into a chute that returns them to the passenger. A centering cam is located on the turnstile shaft which returns the cross arm to its normal off position, no matter what position it is left in. Stop pawls are provided which stop the cross arm momentarily every 90 deg., thus preventing the arm from spinning.



NEW YORK SUBWAY TURNSTILE

A special feature of the fare box is the provision for exposing slugs or foreign coins. Each nickel as it is dropped in the fare box is held before a magnifying lens, strongly lighted, which gives an illuminated image about twice the size of the nickel. The coin remains in that position until the next one is dropped. The enlarged coin is thus visible to a distance of 20 ft. and can be readily detected by the platform attendant.

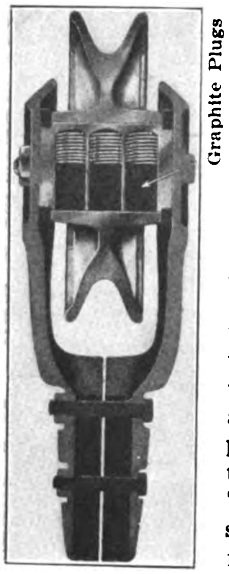
New Air Brush for Paint Spraying

NEW PAINT-SPRAYING BRUSH

THE accompanying illustration shows a form of air brush for paint spraying which is being marketed by the Dayton Air Brush Company, Dayton, Ohio. It is constructed of aluminum and brass and weighs 21 oz. In size it is 6½ in. x 11¼ in. The brush, together with air hose, coupling, nozzle and aluminum container, constitutes the equipment necessary for connecting to the air line. Among the advantages claimed for this new brush is that it will handle material varying in weight from the lighest disinfectant to the heaviest lead and oil paints, without special preparation. It is self-cleaning and requires but a few seconds to change from one color to another.

Graphite Lubricated Trolley Wheel

A TROLLEY wheel and harp of new construction is now being marketed by the Dayton Manufacturing Company, Dayton, Ohio, under the trade name of the "Feist" self-lubricating trolley wheel. The bearing or axle of this wheel is made of a special grade of axle steel and is case hardened and ground. This enables worn wheels to be replaced with new ones on the same bearing.



SELF-LUBRICATING TROLLEY WHEEL AND HARP

Three spring-compressed plugs of hard graphite are inserted in the bearing which keep the interior convex bearing surface of the wheel lubricated. The three bores or chambers containing the lubricant are preferably located at that side of the bearing opposite to the side where the wheel engages the trolley wire, thus avoiding a reduction in area of the bearing surfaces at the points where these surfaces receive the pressure from the trolley wheel. This provides a maximum contact surface for conducting the current from the trolley wheel to the axle.

The "Feist" trolley wheel harp is made of malleable iron, and is of split design, as shown in the accompanying illustration. At points where nuts or bolt heads project, protection is afforded by ribs formed on the outer sides. These serve to deflect the trolley wire past the bolt heads or nuts, should the trolley leave the wire.

New Lubricating Feature for Trolley Retriever

THE TROLLEY SUPPLY CO.
PATENTED
MASSILLON, Ohio. U.S.A.

SPECIAL LUBRICATING FEATURE FOR TROLLEY RETRIEVER

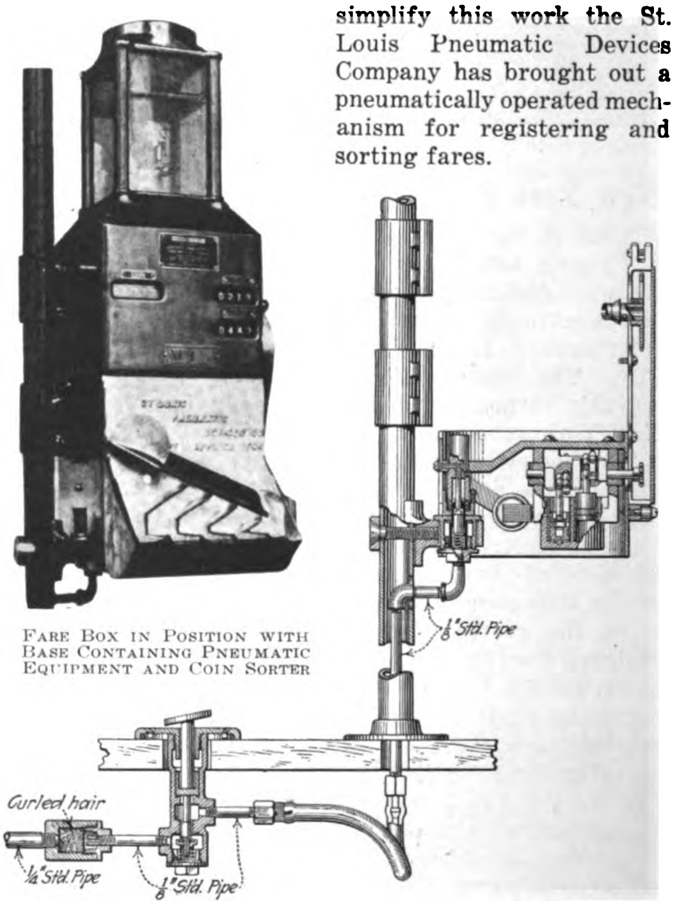
THE accompanying illustration shows a new lubricating feature which forms the latest development of trolley retrievers manufactured by the Trolley Supply Company of Massillon, Ohio. An oil chamber is provided in the control portion with an opening to keep the axle lubricated. Oil is supplied to the reservoir through an opening with a screw plug which effectively closes the oil hole in the reel and prevents any leakage. This design makes it unnecessary to dismantle the retriever or remove it from the car in order that it may be lubricated.

New Light-Weight Motor Developed

TO MEET the requirements of mass transportation with large light-weight double-truck cars and with safety cars heavier than the universal standard, a new light-weight motor has been developed by the Westinghouse Electric & Manufacturing Company. This new motor, known as type 510-A, is of the box-frame, commutating-pole type of 35-hp. capacity. Improvements in construction of the shaft, bearing, housing, and brush-holder are embodied in this new development. The ventilation paths are of the very latest design and afford ample protection when the motor is mounted on small-wheel cars. The 510-A motor is especially suitable for replacing obsolete motors on single-truck or double-truck cars when changed from two-men to one-man operation.

Pneumatic Operation of Fare Boxes

OPERATION of cars by one man has now reached such extensive proportions that considerable effort is being devoted to designing devices which will reduce the labor of the operator. The cranking of a fare box is one of the things which consumes considerable time at points where the operator's attention could be devoted more advantageously to operating the car. To simplify this work the St. Louis Pneumatic Devices Company has brought out a pneumatically operated mechanism for registering and sorting fares.



FARE BOX IN POSITION WITH BASE CONTAINING PNEUMATIC EQUIPMENT AND COIN SORTER

PNEUMATIC OPERATING EQUIPMENT FOR FARE BOXES

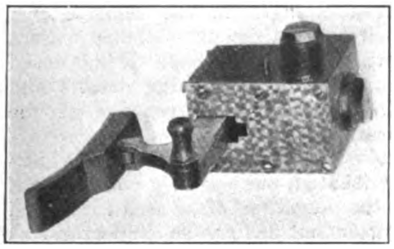
The accompanying illustrations show this equipment. In service the operator presses downward on a pedal and the fares which have been passed by the inspection tray in the fare box are promptly registered in the same manner as is accomplished by hand. The operating mechanism is self-contained in a separate compartment at the bottom, and if the fare box is to be used without the pneumatic attachment it can be readily lifted off and the usual hand-lever operation can be restored without alteration.

The pneumatic equipment consists of the pedal which operates a pneumatic valve installed underneath the car floor or a raised portion of the vestibule if such is desired. The pneumatic valve admits air through a curled hair strainer directly from the air system of the car to the operating mechanism at the bottom of the fare box. Connection is made through the stanchion which supports the fare box. The operating equipment consists of a small pneumatic motor which operates the fare registering mechanism through gearing and a chain belt.

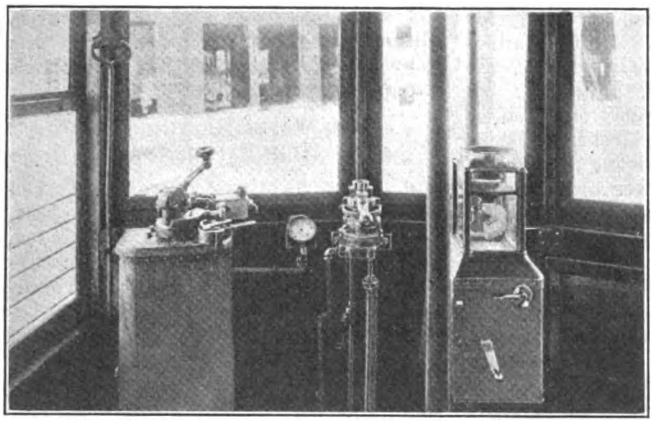
A coin sorter has also been added as a part of this equipment. It can be attached to the fare box either in conjunction with or independent of the pneumatic device. As soon as the coins have been properly registered they drop into their respective pockets and can be removed without visual inspection. The use of these devices makes it possible to register and remove the coins without diverting the attention of the operator from the roadway. The car operator can perform this registration by using his foot either while receiving fares or after the car has been put in motion. The pneumatic method handles the fares more rapidly than can be done conveniently by hand, but the real time saving lies in the fact that pneumatic registration can be done with much less effort and coincident with other duties.

Automatic Bell Ringer and Controller Lock

ACCOMPANYING illustrations show equipment recently brought out by the National Safety Devices Company, Waterloo, Iowa, for automatically ringing the gong of an electric car as the car is started. The controller lock is 3½ in. x 6 in. in size and weighs 7 lb. The apparatus is arranged for attachment to the standard type of controller. An air pipe connects the main casting of the controller lock with the air supply of the car and a second pipe runs from the casting to the bell-ringing device. When mounted the movement of the controller handle operates the lever of the lock, thus opening a valve which admits air to the bell-ringing equipment. A safety feature is also provided in that the equipment locks the controller handle in position so that it cannot be moved should the air pressure be insufficient to apply the brakes. The bell is rung during the first forward movement of the handle and further movement stops the ringing. A rocker arm attached to the operating lever permits the throwing off of the controller without moving the lever or ringing the bell.



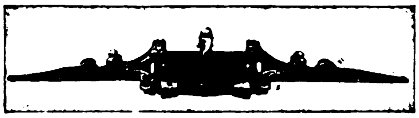
CONTROLLER LOCK OF BELL-RINGING DEVICE



CONTROLLER LOCK AND BELL-RINGING DEVICE APPLIED TO THE CONTROLLER OF A SAFETY CAR

Section Insulator with New Features

THE Ohio Brass Company, Mansfield, Ohio, has developed a new type section insulator, designated as type A-4. A rocker clamp is used for holding the trolley wire which has a cam action, so that as the trolley tension increases the hold on the clamp increases. The clamp is notched to grip the wire firmly and is attached by two bolts. All of the trolley tension is carried in this insulator by two 1¼-in. wood strains in the same horizontal plane as the wire. This is done to prevent buckling of the beam. Pull-off eyes are also in the same plane as the wire, which prevents the tendency of the break to tip in case the strain is slack on one side.



NEW SECTION INSULATOR

The device is fitted with renewable 6-in. cam tips and a renewable runner piece. Feeder lugs are provided on each end casting. The insulator is usually direct suspended from the span, but the yoke casting may be removed and a standard insulated hanger substituted.

Letter to the Editors

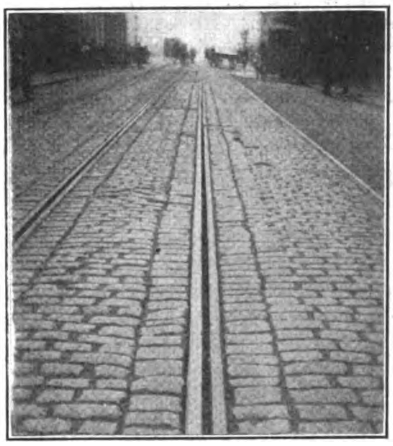
Side Conduit in Brussels

SYRACUSE, N. Y., Dec. 5, 1922.

To the Editors:

On page 856 of the issue of the *Electric Railway Journal* for Nov. 25, 1922, mention is made of conduit track construction in Brussels, Belgium. This particular track construction, I believe, is unknown in American practice. The accompanying illustration, a photograph taken this fall on one of the main streets in Brussels, plainly shows the location of the slot in the street.

The conduit is not located in the center of the track but on the side, adjoining the inside track rail. The slot is formed by one track rail and a slot rail, the slot rail performing the function of the paving lip of the usual type of girder track rail. The plow is suspended from the side of the truck frame of the car. Two plows are used, suspended side by side. Only light single-truck cars, usually hauling one trailer, are used. This type of track construction does not permit of the use of cross-overs, but track loops must be used at the end of double-track car lines.



SIDE CONDUIT IN BRUSSELS

J. KAPPEYNE.

Mechanical Engineers Hold Annual Meeting in New York

Power Generation Was an Outstanding Topic, Stokers Being Exhaustively Considered—High-Pressure Steam, Feed-Water Heating, Boiler Baffling and Other Power-Plant Subjects Were Considered—The Relation of the Engineer to the Public Was Not Overlooked

THE forty-third annual meeting of the American Society of Mechanical Engineers, held in New York City, occupied the four days from Dec. 4 to 7. It was characterized by a number of joint sessions with other organizations, including the American Society of Safety Engineers, and by the evidences of great committee activity. Engineering economics was a topic stressed strongly, and the ideal relation of the engineer to the state was pictured. The leading editorial in the issue of this paper for Dec. 9 brought out some of the high spots in the presidential address of Dean Dexter S. Kimball, in which these features were outlined.

The meeting was attended by 1,200 registrants. While this was but about two-thirds the number in attendance last year, the lack of numbers was made up in efficiency and enthusiasm.

RESULTS OF ANNUAL ELECTION

Early in the meeting the tellers announced the result of the annual election, as follows: President, John L. Harrington, formerly of Waddell & Harrington, and now head of the firm of Harrington, Howard & Ash, consulting engineers, Kansas City, Mo.; vice-presidents, William H. Kenerson, Walter S. Finlay, Jr., Earl F. Scott and Henry H. Vaughan; managers, A. G. Christie, James H. Herron and Roy V. Wright; treasurer, W. H. Wiley.

Secretary Calvin W. Rice reported on his South American trip, during which he attended the International Engineering Congress at Rio de Janeiro, Brazil. He stated that V. L. Havens, editor of *Ingenieria Internacional*, who represented the American Electric Railway Engineering Association, had been elected secretary of the Congress.

STOKER IS COMPREHENSIVELY TREATED

One of the outstanding technical features of the meeting was the attention given to the grates and stokers of boiler furnaces. Papers were read on these subjects by a number of experts.

As to the modern chain grate, T. A. Marsh, Green Engineering Company, said that this type of grate is best for burning high-volatile, free-burning high-ash clinkering coals. Maintenance cost is low and the auxiliary power requirements are small. Efforts to improve efficiency have been directed toward eliminating excess air and reducing furnace and ashpit losses. The forced-blast chain-grate stoker is adapted particularly for free-burning coals that require agitation of the fuel bed to prevent caking.

George I. Bouton, Murphy Iron Works, spoke regarding overfeed inclined stokers. These, he said, are of two classes, side-feed, double-inclined, or V-type, and single-inclined. Those of the first type may have either a flush-front setting (for small boilers) or a Dutch oven setting. They are made with 1 sq.ft. of projected grate area for each 62.5 sq.ft. of heating surface in large boilers, and with 50 sq.ft. in small ones. The fuel bed is 8 to 10 in. thick at the upper end of the grates, thinning down gradually to the clinker grinder. Forced draft is sometimes added to this type of stoker where more than about 200 per cent of rating is desired. As high as 300 per cent can thus be secured.

The speaker referred to the well-known Roney stoker, as illustrating the second type, and also to the Wetzel stoker. The latter consists of bars extending from front to rear, the whole being given a peculiar rocking motion.

The underfeed stoker was covered in papers by H. F. Lawrence, American Engineering Company, and A. H. Blackburn, Underfeed Stoker Company of America. Both traced the development of this type. Mr. Lawrence said that it is particularly adapted for burning bituminous and semi-bituminous coals, and can be adapted for lignites and coke braize. It is quick to respond to load demands.

Automatic regulation was stated to be receiving much attention, but Mr. Lawrence said that probably no regulating apparatus would be developed that would obviate the necessity for occasional adjustment. Clinker adhesion to furnace side walls, one of the most serious operating difficulties encountered, has been largely obviated by the use of perforated firebrick blocks along the clinker line through which air is blown from the stoker air duct, by high-side tuyères, by cast-iron side-wall air boxes, or in some cases by the use of carborundum brick.

Mr. Blackburn traced the developments in stokers from the first Jukes patent in 1838 up to the present day. He covered underfeed single and multiple-retort stokers, underfeed lateral-retort stokers, overfeed inclined-grate stokers, and traveling and chain-grate stokers.

PIONEER INVENTOR HEARD FROM

The extemporaneous discussion on stokers was opened by W. R. Roney, inventor of the Roney stoker, who reviewed stoker history and emphasized the importance of the human element. The consensus of opinion was that the chain-grate stoker is best adapted for burning high-ash Western coal.

In connection with the operation of the chain-grate stokers, however, T. L. Mainz pointed out that among points to be watched is the amount of carbon in the ash and trouble with the seal at the end of the stoker. He said that the best results could be obtained by having a uniform size of coal sent to the grate and that this was a part of the function of the coal-handling system. Another point he mentioned was that the boiler-room dirt must be eliminated when using forced draft under the chain-grate stoker. Further discussion brought out the fact that several types of the modern stoker had solved these problems successfully.

GETTING HIGHER EFFICIENCY OUT OF THE POWER PLANT

A number of papers were presented at a special power session of the convention. In these and the following discussion the interest centered in the utilization of more of the energy available in steam. An important paper was one by Geo. A. Orrok, consulting engineer, New York City, on the commercial economy of high pressures and temperatures. He concluded that as long as the present Rankine cycle is used in the developing of mechanical power from steam there can be little, if any, economic gain by increasing either pressure or temperature beyond present commercial limits. The conclusion is subject to modification in cases of changes in the relative cost of fuel and equipment. Under present conditions the chief hope of increased economy lies in perfecting details and obtaining a larger percentage of the theoretically available heat.

Mr. Orrok's conclusions were vigorously debated, one speaker pointing out that the question of a small thermal saving is not nearly so important as low first cost, simplicity and absolute reliability. Opinion was divided as to the practicability of providing fittings for high pressures and temperatures, although in general it appears that this is possible for values within the present range of practicability.

FEED WATER HEATING FOR HIGH EFFICIENCY

A paper on the economics of feed heating, based on a 25,000-kw. plant, was presented by Linn Holander, Westinghouse Electric & Manufacturing Company. He investigated conditions using single-stage and multiple-stage condensate heaters, both with and without economizers, and treated the subject from the thermal standpoint only.

For power plants using single and multiple stage heaters of the condenser type, the temperature of the boiler-feed water as it leaves the heater should not be less than 150 deg. F. when using economizers and not more than 260 deg. F. when not using economizers. Heat balances showed that when using single-stage heating and no economizers better results were obtained from heating the feed water by combining steam from the house turbine and that bled from the main unit than when using the steam from a house turbine alone. Double-stage heating with no economizers also showed better thermal efficiencies when using a larger amount of steam from the main unit than from the house turbine.

Practically the only adverse criticism made by those who discussed the paper was that perhaps too much attention had been paid to the house turbine, the opinion being that the house turbine as an important factor in power-plant economy would soon generally be replaced by bleeding of the main units. F. Hodgkinson, Westinghouse company, said that the only excuse for the house turbine is to secure reliability of auxiliary power, which can be obtained in other ways. Practically all large turbines are now designed to permit of bleeding, a common plan being to allow four connections, 140 deg. F., 200 deg. F., 50 lb. absolute pressure and 120 lb. absolute pressure.

RESULTS OF EXTENDED BOILER TESTS WERE GIVEN

One of the striking papers presented was by Paul W. Thompson, Detroit Edison Company, on boiler tests at the Connors Creek plant, aggregating fifty in number and involving four grades of coal and four arrangements of baffling.

As a result of these tests seventeen of the large boilers have been rebaffled with considerable improvement in efficiency and degree of superheat, and the Babcock & Wilcox Company has developed a new design of this type of boiler. The baffling arrangement selected exposed two layers of tubes to the radiant heat of the furnace and allowed the gases to cross the inner bank of tubes at the top, pass the superheaters and then return along the outer bank of tubes to the stack. With this arrangement an average increase of 50 deg. F. in superheat was obtained, the flue-gas temperature was reduced 70 deg. and the draft was reduced 38 per cent.

Discussion of the paper showed appreciation of such careful work as was reported.

THE PROBLEM OF ASH HANDLING

An elaborate paper on this subject was presented by John Hunter and Alfred Cotton, St. Louis, Mo. It covered all phases of ash handling and forms a treatise in this field. The discussion brought out the fact that, while water and fuel-handling problems of the power plant have been satisfactorily solved, those of ash handling are difficult and elusive. The quantities to be handled are apt to vary widely and the disposal of ashes often is difficult. Continuous quenching by spraying was advocated and also the frequent replacing of worn metal in conveyors rather than the attempt to prevent wear.

RAILWAY-MOTOR PINION TOOTH STRESSES VISUALIZED

Electric railway equipment men will find interesting information regarding gear-tooth stresses in a paper presented by Dr. Paul Heymans, of the faculty of the Massachusetts Institute of Technology, and A. L. Kimball, General Electric Company. They applied what is known as the photo-elastic method for their purpose, that is they subjected celluloid models of the teeth to stress and passed polarized light through them. The deformation produced by the stress was thus made visible. In the paper photographs in colors were given, as well as diagrams worked out on a quantitative basis. They emphasized the value of this method as compared with ordinary engineering analysis.

The authors studied the effects both of inside radial pressure, such as is due to driving or shrinking a pinion on the shaft, and of applied torque load. They checked their scientific analysis by tests on actual pinions and upon steel rings forced on a tapered plug. Their tests showed that the gear pinion is weaker than the plain circular ring whose outside diameter is equal to the root diameter of the tooth. Gears, they say, fail due either to (1) poor design; (2) excessive load, or (3) excessive radial pressure due to procedure in mounting on the axle.

VOCATIONAL TRAINING VIGOROUSLY DISCUSSED

A report was presented by the A.S.M.E. committee on education and training for the industries which was the subject of lively discussion. The report and discussion were summarized at the close by President Ira N. Hollis of Worcester Polytechnic Institute. He said that the tendency today is not to educate for menial positions, but to train for the best citizenship. An education must train men, first, to make a living, and second, to use their spare time for advancement, intellectual as well as professional. He deplored the desire on the part of many colleges to create an "intellectual aristocracy," to limit the number of college students to the future leaders. Who knows, he said, who the future leaders are to be?

In the discussion the value and relative fields for apprentice training, correspondence and extension courses, etc., were thoroughly covered.

Live Railway Topics Practically Discussed

At a Well-Attended Meeting of the Eastern Section of the Engineering Council of the Central Electric Railway Association, Equipment and Other Technical Problems Were Discussed Frankly and Fully

THE November meeting of the eastern section of the engineering council, Central Electric Railway Association, was held at the Hotel Windsor, Wheeling, W. Va., on Nov. 14. Forty members and railway specialty men were in attendance. L. E. Earlywine, secretary of the association, had issued questionnaires which formed the basis for discussion. The same questions will be discussed by other sections, and the entire council has been asked to send replies to the association office at Indianapolis, where they will be tabulated and distributed to the members. The questions, together with a summary of the discussion which occurred at Wheeling, are given below:

What is the effect on motor and gear maintenance of too much wear on body and collar of axle bearing? (a) What is permissible wear on the body of axle bearings? (b) What is permissible wear on collar of axle bearings?

In a lively discussion of these questions it was brought out that excessive wear on the collars or flanges of axle bearings permits the motor to lunge from side to side as the car hits sharp curves or sways from side to side. This aggravates the condition, causes the armature to pound its bearings, and results in sparking at the commutator. It permits misalignment of the gear and pinion faces and results in more rapid and uneven wear of both. This wear causes the tooth loading to be thrown upon the tips of the teeth, resulting in tooth breakage if allowed to continue for any length of time. The following allowances were given by some of the members: C. W. Folwell, ⅛ in.; Daniel Durie, ⅛ in.; F. C. Martin, ⅛ in. on shaft or ¼ in. on collar; A. B. Creelman, ⅛ in. F. W. Hickling, Westinghouse Company, stated that good practice places the maximum allowable wear on the body of axle bearing at 3/32 in. With new bearings it should not exceed 0.012 in. as the bearings go into service. The amount of wear on axle bearing flanges is not so vital if the wear is taken up by means of the axle collar. The clearance permitted should not exceed 3/16 in. With new bearings this should not exceed 1/32 in. upon going into service.

There appears to have been but little improvement in gear case design for twenty years. What suggestions for improvement in design are recommended?

Mr. Hickling stated that gear cases have been materially improved, both with respect to the pan and the end support. Since the advent of the pressed pan, the principal improvements have been in the supports. The development along this line is in the direction of making a support strong enough to meet severe service conditions. The discussion further brought out the fact that supports were continually breaking and appear not to be heavy enough. Also heavy cases appear to break supports, due to vibration, more than do light sheet steel cases.

What are the advantages, if any, in the use of overhead ground wire for high-voltage transmission lines? (a) What kind of wire is used? (b) How installed? (c) Method of grounding.

Mr. Hickling said that briefly summarized the records of his experience with overhead ground wires show the following:

1. Overhead ground wires do afford a certain protection to insulators. Quantitively, however, the extent and value of this protection are uncertain.

2. Overhead ground wires do not afford any appreciable protection to wood poles in addition to that afforded by individual grounding wires on each pole (except possibly in regions where grounding conditions are exceptionally poor).

3. There is evidence that overhead ground wires do afford protection to station apparatus. The preponderance of evidence indicates, however, that the amount and value of this protection are not material.

4. It is not definitely known whether overhead ground wires tend to reduce disturbances which result in interruption to service without occasioning damage to lines or equipment.

5. Overhead ground wires tend to give better relaying conditions on systems with a grounded neutral. Their value in this respect will depend upon type of relays employed, individual ground conditions and other local conditions.

6. Overhead ground wires add to the longitudinal stiffness of transmission line structures when attached directly to the structure, and to a small extent when carried on a bayonet or crossarm. The extra wire, however, increases the wind and ice loading on the line.

Discussion brought out the fact that stranded steel wire is generally used, its size being fixed by mechanical considerations because the size of the ground wire has very little effect on the capacity to the line wires. On wooden pole lines some companies carry the wire on insulators and others do not. On steel tower lines the wire should be grounded at every tower. On wooden pole lines the general practice is to ground at every fourth or fifth pole.

What effect, if any, does fast controller feeding have on equipment?

The discussion showed as follows:

Effects are most noticeable in city service where frequent stops occur with close headway of cars. Generally, too rapid notching causes more equipment failures and increased maintenance cost. Also, on small railway systems wide fluctuations occur in line voltage and in substation loading.

On short runs, fast controller feeding frequently is one cause of overheating of motors. The tendency of some motors to flash is also increased because the motor is saturated magnetically from the high accelerating current while the rapid notching imposes sudden and wide voltage variations in the motor. Excessive heating dries out insulation, thus producing loose bands and windings. The excessive accelerating currents set up magnetic stresses which produce severe mechanical strains in the windings and sometimes cause broken armature leads.

Gears and pinions are subjected to severe shocks because of the rapid and wide variations in the tractive effort. Controllers wear out contacts and fingers unduly because of the excessive currents handled. Circuit breaker operation is more frequent. Large drafts of power from the line may reduce line voltage too low for satisfactory operation of multiple-unit equipment. Flickering of car lights becomes a source of annoyance to passengers.

What is the best practice for making emergency stops to avoid accidents?

The general opinion seemed to be that the length of stop depends on the condition of the rail and the best judgment of motorman. On dry rail sand should be dropped and brakes applied to emergency. On wet rail sand should be dropped and air used with judgment and if necessary current should be applied to keep wheels moving to prevent sliding.

It was agreed that reversing a car has some effect on a jury verdict, in serious accident cases; that reversing might do at very low speed and, if reversing is necessary, the reverse handle and not the power handle, should be used.

What is the most economic size and shape of trolley wire: (a) for city cars; (b) for interurban cars?

The discussion indicated that No. 00 round is most universally used, with the exception of some of the larger cities. Chicago uses No. 000 round and Philadelphia both No. 00 and No. 0000 round. The No. 00 round wire is easier to install because of less load on cross bands. This is of considerable importance where there are wide streets and steel poles are used without back-guys.

Mr. Hickling said that Westinghouse engineers believed that for interurban lines the No. 0000 grooved trolley wire is the best. Interurban work is mostly high speed, and with the grooved trolley wire a smooth under-run is obtained. This results in the elimination of sparking at the trolley ears and also reduces maintenance as with round trolley wire and drawing heavy currents, the trolley ears would need to be frequently renewed.

Should track bonding be installed and maintained by track or overhead departments?

There was considerable difference in opinions which included line and track departments and a special engineering department to take charge of this.

What effect has bad track in the upkeep of equipment?

A lively discussion took place on this subject as to the damage to equipment. The cost of upkeep varies in some proportion to the condition of the track. Probably 80 or 90 per cent of the maintenance cost on motors is due to troubles resulting from vibrations. One source of these vibrations is bad track, which tends to hammer at the bearings and gears and set up vibration of the brushes, which is a common cause of flashing. It is due to the prevalence of bad track that railway motors have to be made as rugged as they are.

On motors mechanical troubles predominate, and the bearings suffer the most. Brushes come next, and loosening of windings and covers last. Flashing may occur by the bouncing of brushes, or broken windings occur from the extreme poundings. Controllers of the drum type are not affected to a great extent. Remote control relays and some types of contactors may be bounced shut or open, thus giving false operation. Riveted and bolted joints frequently open. Undue strains may be thrown on the supports, air piping or on the apparatus frames, thus causing breakages and delays in service.

The effect of bad track upon the upkeep of equipment might be compared to a leak in a steam or air line. It rapidly goes from bad to worse, and is an expensive luxury. The continuous poundings vertically and laterally cause general deterioration of all equipment, both electrical and mechanical. It tends to loosen all bolted and riveted parts; causes brush and brushholder chattering; produces sparking and flashing on commutator; breaks off the leads both on the armature and on stationary parts of the motor, and adds severe strains to the gear and the bearings. It causes rapid wear of trolley parts and increases the breakage of overhead structures.

A. B. Wilson, sales manager of the Copper Products Forging Company of Cleveland, presented to the meeting the features of the "Cleveland" all copper trolley wheel, and L. E. Gould, president of the Economy Electric Devices Company, explained the new aluminum fields for railway motors.

After the meeting adjourned a trip was made by special car to the Windsor power plant of the West Penn Railway at Beach Bottom, where interesting features of the large power station were observed.

The New York Railroad Club Celebrates Fiftieth Anniversary

THE dinner this year of the New York Railroad Club took the form of a golden jubilee, as the club was organized in 1872. About 2,300 members and guests were present at the banquet which was held at the Hotel Commodore on Dec. 12. H. H. Vreeland, Interborough Rapid Transit Company, was toastmaster, and the principal addresses were given by John J. Cornwall, ex-Governor of West Virginia and general counsel of the B. & O. R.R., and George A. Post, chairman railroad committee, Chamber of Commerce, U. S. A.

New England Street Railway Club

THE December meeting of the New England Street Railway Club was held in Boston last Thursday. The afternoon meeting was at the Engineers' Club and was addressed by Joseph C. McCune, Westinghouse Air Brake Company, on recent developments in air brakes for electric cars.

The evening meeting was at the Copley-Plaza, and W. L. Underwood of the M.I.T. gave an illustrated lecture on hunting big game with a camera in New Brunswick.

Meeting of Committee of One Hundred

THE Committee of One Hundred. which was organized in 1919 shortly prior to the Federal Electric Railways Commission hearings to give currency to electric railway facts, held a meeting at the Railroad Club in New York on Tuesday, Dec. 12, and decided to continue its existence indefinitely and broaden the scope of its work. About twenty-five members of the committee were present and after a report from Gen. Guy E. Tripp, chairman of the committee, was presented, the plan for continuing the work of the committee was unanimously approved.

General Tripp's report showed that since the establishment of the advertising section at association headquarters on Jan. 1, 1920, much information of a constructive character has been cleared to the press and electric railway companies and other channels of advertising and publicity. The good results obtained have been attributable in great measure to the determination of the committee not to make a mere "press agent" service of its information department but to render a real information service to all who desire facts about electric railways. The greatest care has been taken, it was emphasized, to tell the whole truth in each situation and to avoid coloring statements either to the benefit of electric railways or the detriment of their opponents.

Among those who discussed the committee's work, after General Tripp had read his report, were C. D. Emmons, P. H. Gadsden, Barron Collier, F. R. Coates, G. E. Hardy, J. N. Shannahan, J. H. Pardee, J. K. Newman, J. G. White, L. S. Storrs, Thomas N. McCarter, S. Z. Mitchell, O. D. Young and Secretary J. W. Welsh of the association.

All the speakers emphasized the importance of General Tripp and Henry R. Hayes remaining at the head of the work as chairman and secretary of the committee respectively and also of retaining as many members of the committee as possible regardless of whether they were actively engaged in the electric railway business or were in affiliated lines. Several speakers, particularly Messrs. Gadsden and Pardee, paid tribute to the actual handling of the advertising and informational work of the committee. This is carried on by Labert St. Clair, of the Barron G. Collier, Inc., staff, who handled the news of the Federal Electric Railways Commission hearings. Mr. Collier also makes available, without charge to the committee, the service of his entire art and copy departments.

General Tripp's report also told of how information was made available to magazines, the press, public speakers and others, and then summarized the other work of the committee operating through the Advertising Section as follows:

Preparation of booklets, posters, suggested newspaper advertisements and similar advertising material dealing with current situations and forwarding this matter regularly to all electric railway companies in the United States.

Giving counsel and suggestion for special campaigns, when requested by individual companies.

Co-operating with the committee on co-operation of manufacturers by preparing good will electric railway advertising literature and disseminating it through these companies.

Issuing monthly a bulletin publication called "Truth" containing from six to fifteen news items, editorial comment or other material of general interest which may be used in house organs, speeches, interviews and in other ways. This bulletin is distributed to the number of 3,000 copies monthly.

Co-operating with the twenty-five state committees on public utility information, supplying them with regular informational material and rendering special service to meet their local situations.

Co-operating with the National Electric Light Association, American Gas Association and other public utility organizations, as well as the Investment Bankers' Association and other national organizations interested in the welfare of public utilities in the dissemination of facts.

Conducting an Advertising Section in *Aera*, the American Electric Railway Association monthly magazine, giving suggestions for bettering public relations and illustrating the articles with advertising material gleaned from the field.

Henry R. Hayes read a financial report showing that the work of the committee has been financed by voluntary subscriptions to date, and it was decided to continue to meet the expenses of the committee by this method.

Those present were: Messrs. G. E. Tripp, J. K. Choate, J. N. Shannahan, E E. Quantrell, E. W. Sanderson, Frank Silliman, J. H. Pardee, C. M. Clark, G. E. Hardy, S. M. Curwen, P. H. Gadsden, H. V. Bozell, J. W. Colton, F. R. Coates, Barron Collier, C. D. Emmons, R. P. Stevens, O. D. Young, H. R. Hayes, J. G. White, L. S. Storrs, T. N. McCarter, S. Z. Mitchell, H. H. Westinghouse, J. K. Newman, J. W. Welsh and Labert St. Clair.

American Association News

Power Distribution Work Laid Out

THE two-day meeting of the Engineering Association committee on power distribution, held Dec. 11 and 12, was a miniature convention in itself. Seventeen of the twenty-two members were present, besides several guests, and one absentee was represented by deputy. Chairman M. B. Rosevear announced the composition of the sub-committees as follows:

1. *Specifications for catenary construction*—C. H. Jones, chairman; R. L. Allen, S. H. Anderson, L. W. Birch, H. M. Hobart, John Leisenring, W. Schaake.

2 and 4. *Trolley-wire wear and specifications*—H. S. Murphy, chairman; J. W. Allen, H. G. Burd, L. E. Delf, L. F. Griffith, H. D. Hawks, A. Hughes, Jr., H. A. Pharo.

3. *Pole reclamation* — L. F. Griffith, chairman; S. H. Anderson, James Scott.

5. *Inductive co-ordination*—John Leisenring, chairman; D. D. Ewing, H. A. Pharo, A. Schlesinger.

6. *Temporary connections to trolley wire*—L. E. Delf, chairman; L. W. Birch, James Scott.

7. *Overhead construction for trackless trolley* — F. McVittie, chairman; L. W. Birch, H. M. Hobart, W. Schaake.

8. *Review of existing specifications and recommendations to A. E. S C.*— A. Hughes, Jr., chairman; R. W. Eaton, H. M. Hobart, F. J. White.

Next C. H. Jones was appointed vice-chairman of the committee, after which reports were submitted by representatives of the association on the A.E.S.C. sectional committees. A letter from S. L. Foster containing many practical suggestions was read and discussed. The several sub-committee assignments were then taken up with the following general results: No. 1, Not discussed. Nos. 2 and 4, Subject will be covered under two heads; trolley wire wear by the whole sub-committee, and preparation of specifications by Messrs. Murphy, Burd and Hughes. These three men will cooperate with the A.S.T.M. No. 3, It was suggested that cleaning and treating of poles in service be studied and cost data gathered, for publication, on the whole subject of pole reclamation. No. 5, The discussion on this subject brought out the desirability of cooperation with other organizations as opportunity offers. No. 6, Data on this subject will be collected with a view to suggesting the best present and possible practises. No. 7, The subcommittee was given a free hand to gather and analyze information with a view to presenting the high spots in present practice. No. 8, The sub-committee will not only review existing standards but will suggest those which should be submitted to the American Engineers Standards Committee.

On the second day of the meeting the several sub-committees met and made substantial progress in planning the season's work.

PERSONAL MENTION

Commission Appointed

Last Act of Mayor Couzens Outlines Plan for Municipal Operation—Will Serve as Adviser

The last official action of Mayor James Couzens with respect to the street railway question in Detroit before resigning to become United States Senator was to appoint four of the five men who are to make up a special commission to study Detroit's rapid transit situation. This rapid transit commission was authorized about two months ago, when the City Council also authorized the appropriation of $50,000 to carry on the work.

MR. WALDRON CHAIRMAN

The former Mayor outlined the general plan of operation for the rapid transit commission and stated that in his belief a practicable solution of the city's needs should be submitted to the voters by April, 1924. The recommendations of Mr. Couzens on the appointment of the commission were accepted by the Council, and four of the five men named have agreed to serve. The fifth member of the committee is to be appointed by acting Mayor John C. Lodge.

The men named are: Sidney D. Waldron, former vice-president of the Packard Motor Car Company, chairman; Willard Pope, civil engineer; H. W. Alden, vice-president of the Timken Detroit Axle Company, and C. W. Hubbell, former city engineer of the city of Detroit.

In outlining the work the commission will have to do, the Mayor pointed out that that body will have in mind the discussed Metropolitan district, the possible Detroit-Windsor bridge and the need for more rapid interurban service such as the commuting service around New York, Chicago and Philadelphia. All citizens with constructive ideas will be welcome to appear before the commission or to send in their ideas to it.

BUDGET SCHEME PROPOSED

The Mayor stated that it was his understanding that the commission will prepare a budget for prompt submission to the Council, and that expenditures are to be approved by the Mayor and city controller before submission to the Council for payment. The commission will serve without pay.

Mr. Couzens on Dec. 5 resigned as Mayor of Detroit and as acting general manager of the Department of Street Railways, having been informed by the corporation counsel that the offices of Mayor of Detroit and United States Senator were incompatible.

At the conclusion of the Mayor's last meeting with the street railway commission, a statement was issued by Ross Schram, assistant general manager of the Detroit Municipal Street Railway system, to the effect that there will be no changes in the management or policies of the department of street railways, which the members of the commission are satisfied is efficiently organized and operated now.

The commissioners, after conference, decided to accede to Mr. Couzens' request that he be not asked to assume the duties of general manager, but wish to avail themselves of his offer to serve in an advisory capacity, so that they may have the benefit of his ideas, knowledge and experience.

There is no intention of appointing a general manager, pending the return of Joseph S. Goodwin, now on sick leave. In the meantime the necessary duties will be divided among the commissioners.

Agreement Renewed—Proposals Accepted

At a referendum taken on Dec. 6 the trolley men's unions voted to accept the proposals made to them by the Springfield, Worcester Consolidated, Milford, Attleboro & Woonsocket, Interstate Consolidated and Attleboro Branch Railways for the renewal of the working agreement which will expire on Dec. 31. The general terms governing wages are to remain as in operation since March 1 last under the Storrow award. There are several minor changes affecting wages and working conditions.

The arrangement of a seven-hour guarantee in a fourteen-hour spread has been changed to make the outside time twelve hours instead of fourteen. An hour's time will be allowed hereafter to spare men reporting for duty but not sent out, or whose starting may be delayed for that period. Time and a quarter is to be paid for the thirteenth hour or fraction thereof and time and a half thereafter.

Men on schedule runs of seven and a half to nine hours are to receive nine hours pay. The minimum at present is eight hours.

A rearrangement has been made governing method of payment for late-in time, computations to be made separately for each day, instead of being taken collectively at the end of the week, putting Springfield and Worcester on the same basis.

Maximum rates for blue uniform men which are to be continued for one year by the vote thus taken are 58 cents an hour on the Springfield and Worcester systems, 53 cents on the Milford, Attleboro & Woonsocket, and 56 cents on the Interstate Consolidated and Attleboro Branch roads.

Decision Reversed

Circuit Court of Appeals Rules Seattle Is Not Compelled to Use General Fund for Railway Operation

Seattle taxpayers have won another victory in their fight to protect the general tax fund of the city from invasion as a means of meeting the cost of operation and maintenance of the Seattle (Wash.) Municipal Railway. The United States Circuit Court of Appeals has reversed the decision of Federal Judge E. E. Cushman, in the suit brought by the Puget Sound Power & Light Company to put the tax fund behind the $15,000,000 of railway purchase bonds. This is the decision which the city has been awaiting before taking action on the 5-cent fare on city cars. The decision reversing Judge Cushman was filed by the Circuit Court in San Francisco, and the case was sent back to the District Court in Seattle for dismissal.

Judge Cushman's decision, which has been reversed, held that the city must draw from the general tax funds, or any other available fund, in event the revenues of the railway at any time become insufficient to pay the cost of operating the street cars, after payment of bond interest and principal. The reversal of this decree has the effect of holding that the city is not compelled to invade the general fund for the purpose of operating the railway, if the revenue ever becomes insufficient for that purpose. The holding is similar to that of the State Supreme Court in the "fourteen taxpayers" suit, in which the state court held that the general tax fund cannot be invaded for support of the railway.

Telegraphic notice received in Seattle by attorneys in the fourteen taxpayers case, announcing the decision, said the federal suit had been remanded to the lower court for dismissal "without prejudice to any right the power company may hereafter have for future breaches of ordinances or bonds."

JUDGE CUSHMAN OVER-RULED

This decision also removes Judge Cushman's jurisdiction over the railway system, which he assumed in the decree which has been reversed, to enforce specific performance of the terms of the contract under which the railway was purchased from Stone & Webster.

The Circuit Court finding held that the Cushman decision was unnecessary because the railway is paying expenses out of its revenues, and that the municipal officers of Seattle had acted within their rights in effecting a transfer from the general fund for the purpose of investigating charges that the city had been defrauded in the purchase of the system. The passage of the enabling ordinance to make effective the terms of the bond contract the court also found to be fully sustained by law, and not subject to attack because it was passed by the City Council, and not by the electorate as a whole.

One of the provisions of the Cushman decree which had a bearing on street car fare was that under which the Federal Court retained jurisdiction of the case, and under which the power company was given the right to call the city into court on twenty days notice in event any steps were taken in conflict with the interests of the power company. As this provision has been stricken out by the Circuit Court's decision, attorneys point out, the jurisdiction of the court has been removed, and the company would have to begin new litigation, in event it considered its efforts were being jeopardized.

James B. Howe, attorney for Stone & Webster interests, who brought the specific performance suit in the Federal Court, states that he is not prepared to say whether the case will be appealed to the United States Supreme Court until he has seen the decision of the Circuit Court.

Mayor B. J. Brown and City Councilmen predict that with the favorable court decision, early adoption of a 5-cent fare on the lines of the Seattle Municipal Railway will be possible. However, it is agreed that no change would be politic before Feb. 1.

Numerous suggestions for reducing fare in the city have been offered by Councilmen and railway officials, but to date no agreement has been reached. The suggestion of Councilman John E. Carroll that the weekly pass system be tried has not met with the approval of the Council, and the suggestion has been permanently tabled.

The Council is now considering a report of Superintendent of Public Utilities George F. Russell, requested by Councilman Erickson, which indicates that there will be a monthly operating loss of from $70,000 to $200,000 from the various fare reduction plans. The report did not take into consideration a probable increase of 13 per cent in business of the railway, which the utilities chief said might result from the reduced fare. For the various proposed plans, his report indicates the following estimated operating losses:

Five-cent fare, with 1¼-cent transfers (Mayor Brown's plan); net operating loss of $129,227, and including the $70,250 monthly allotment for redemption of bonds, a loss of $199,477 a month.

Five-cent fare, with free transfers, net operating loss of $146,880, with bond redemption, $217,130 monthly; 5-cent fare with 2-cent transfers, total operating loss of $188.825 a month; 6¼-cent fare with free transfers, total operating loss $142,961; 6¼-cent fare with 1-cent transfers, total operating loss $128,759; 6¼-cent fare with no transfers, a net operating gain of $16,055, but a total operating loss, counting bond redemption of $54,195; 5-cent fare, and no transfers, net operating loss of $75,967, and with bond redemption, $146,217 a month.

Superintendent Russell pointed out that under the present 8⅓-cent fare, counting the $57,000 depreciation charge (a mere book account, for which only $20,000 is actually set aside) there is an average monthly fictitious operating loss of $12 101.

In ten months of 1922, Superintendent Russell said, the expenses of the Municipal Railway were decreased $405,491 as compared with the corresponding period in 1921, a decrease of 10.91 per cent. The decrease in expense next year, he predicted, will be even greater than this.

Franchise Awarded

San Diego Railway Pays One Hundred Dollars for Privilege of Building Cross-Town Line

The franchise for the cross-town line on Sixteenth Street, San Diego, was formally awarded to the San Diego Electric Railway by the City Council on Dec. 4, after a stormy fight, which was finally decided by the issue being submitted to the people at a special election on Oct. 10, and at which election the company won its point, the electors approving the franchise by a small majority.

The company first made application to the City Council for the franchise in April, 1922, stating that the cutoff was necessary to facilitate reconstruction work then under way, and also for rerouting of cars to meet the needs of the growing city. The granting of the franchise was opposed by an association of merchants with establishments located on lower Fifth Street and Market Street, who asserted that if the franchise were granted the company would so reroute its cars as to kill their section of the city as a retail district. The Council heeded the merchants and refused to grant the franchise. The company renewed its application in July, having procured the approval of its plans by the State Railroad Commission, but again the Council listened to the merchants' association and refused the franchise. The company then took the fight to the people, circulating petitions, and secured the necessary signers to a petition calling a referendum election on the question, and at the election the people approved the franchise.

Opponents of the franchise then took the fight to the Superior Court, asking that the City Council be enjoined from granting the franchise as voted by the people, claiming that the election was not authorized under the city charter, that franchises were not a subject for referendum elections and that the power of granting franchises rested solely with the City Council. A temporary injunction was granted, but at the hearing attorneys for the plaintiff, the city and the railway company being heard, the court dissolved the injunction. The plaintiff gave notice of appeal.

The franchise was then put on the City Council's calendar for action on Dec. 4. Early that morning the attorney for the opponents of the franchise again applied for an injunction on the ground that the franchise should not be granted while the question of validity of the election was on appeal, but the court denied the application without even asking for argument, stating that the court could not see where any irreparable injury was threatened. The claim of the merchants that their business would be adversely affected by rerouting of cars, the court said, was not well founded, as no one could foresee what the results of the rerouting would be.

The Council then sold the franchise to the San Diego Electric Railway for $100, it being the only bidder. The general terms of the franchise are the same as those of the general franchise held by the company.

Claus Spreckels, general manager announced that construction of the Sixteenth Street line would begin as soon as the material could be assembled, which will be in about two weeks. The work will be done according to the new standard adopted by the company —twin-steel ties, 100-lb. rails, all electric welded and embedded in 14 in. of concrete. It will be necessary to build four blocks of double-track line on Sixteenth Street to connect existing lines, or the equivalent of a little more than one-half mile of single-track.

It is estimated that the company will save $10,000 a year in car mileage to and from the carhouse at Fifteenth and L Streets through use of this new line. National City and Chula Vista cars also will be routed over the new line, and probably the Logan Avenue line, leaving the Imperial Avenue and Market Street lines to serve lower Fifth Street.

Council Adopts Agreement—People Will Vote in January

The City Council of Ottawa, Canada, by a vote of eighteen to three, on Dec. 8 adopted the report of the civic street railway committee which provides for submission to the voters questions affecting the operation of the Ottawa Electric Railway. The proposed franchise agreement, including Robert M. Feustel's recommendations for extensions, was referred to in the *Electric Railway Journal*, issue of Nov. 25.

The questions on which the people will vote are whether the city shall sign an agreement for a new franchise allowing a flexible rate of fare and a guaranteed return of 7½ per cent to the company on $4,500,000, and on $500,000 to the city, which is the city's equity in the road, or whether the city shall buy out the Ottawa Electric Railway Company, its property and assets for $4,500,000, and have it operated by an independent commission. This commission, it was explained, would consist of three members, who would be appointed by the City Council.

The Council also passed a motion authorizing the city solicitor to have a synopsis of the agreement prepared for publication three times in each of the three daily newspapers.

The present agreement does not expire till August of 1923, but in the event of the new agreement being approved the company is willing to date the agreement from January and start at once on the extensions.

Commission Holds Hearing on Extension Application

Permission to construct an extension of its Monrovia-Glendora line easterly 4 miles to connect with its San Bernardino line at San Dimas Junction, along with the necessary permits to cross twenty streets and the tracks of two different steam road lines at grade in and near Glendora, Calif., was asked on Dec. 6 by the Pacific Electric Railway at a hearing held before Examiner W. R. Williams and engineers of the State Railroad Commission at Glendora. When this line is completed, this cutoff will enable persons living at Glendora, or between that city and Los Angeles, to travel east to San Dimas Junction and other points on the company's lines in that territory without coming to Los Angeles and going out on a parallel line as has been necessary in the past. It also will make it possible for persons living at San Dimas and points east thereof to go to Glendora and other near-by points, including Mount Lowe, without coming first to Los Angeles. The railroads which the company asks permission to cross are the Atchison, Topeka & Santa Fé and the Southern Pacific.

Vote Down Renewal Franchise

The renewal of the franchise of the Rockford-Interurban Railway, a subsidiary of the Commonwealth Power, Railway & Light Company, was voted down at a special election in Rockford by a vote of 7,300 to 4,100. The City Council had previously voted for renewing the franchise over the Mayor's veto.

The franchise expires in October, 1923. The terms of the new franchise grant were referred to in the *Electric Railway Journal*, in the issue of Oct. 21, 1922.

Construction Awaits Amicable Settlement of Differences

The County Board of Revenue of Jefferson County, Birmingham, has threatened to withdraw $450,000 set aside for street construction within the city limits, unless the City Commissioners and the Birmingham Railway, Light & Power Company can get together on their long standing controversy as regards the right-of-way over certain streets of the city.

For some months it has been planned by the County Board of Revenue and the City Commissioners to pave certain streets leading from the center of the city, in conjunction with the federal aid appropriation. The right-of-way over these roads is owned by the Birmingham Railway, Light & Power Company. The city and the company have been in a controversy over this right-of-way for some time, and the matter remains unsettled.

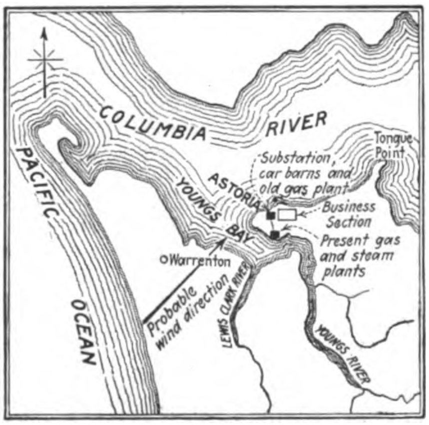
City Commissioner W. E. Dickson stated that he believed this right-of-way could be secured before Dec. 15, the date set by the County Board of Revenue to withdraw the appropriation, in the event the right-of-way was not secured by that time.

Astoria System Hard Hit

But Speedy Resumption of Electric Service Follows the Fire in That Oregon City

Destruction of the electric light and power distribution system in about thirty-five city blocks in the heart of Astoria, Ore., was caused on Dec. 8 by the fire which started at 2:30 a.m. and burned until noon. The loss includes that of the meters and transformers in the burned area, which included the main business section of the city and some residence blocks.

The part of the city destroyed was built principally on filled-in land, some parts of which have been filled to the street level. but the part which burned first was filled to within about ten feet of the street level. The paved streets in this section were supported on timber trestles, and the tunnel thus formed was used for electric light and telephone cables, gas and water mains and sewers. This tunnel construction provided a flue for the burning timber that carried the fire throughout the burned area in a short time, causing the failure of both the gas and water mains because of the loss of the supporting structure and the falling of the street pavement. The failure of the water supply in certain sections from this cause proved a serious handicap in fighting the fire. At least fourteen blocks of street-railway track were destroyed and through service permanently interrupted.



SKETCH SHOWING VULNERABILITY OF ASTORIA TO FIRE

The Pacific Power & Light Company owns and operates the street railway, electric light and power and gas properties, and much credit is due the company for the promptness with which service was resumed by all these properties. Fortunately the main electric feeders for the burned district were on Boundary Street, just beyond the fire zone, and this area was soon cut off from the rest of the city. Many arc lights were back in service on the first night, and within twelve hours after the fire nearly every light and power customer outside the burned area was receiving uninterrupted electrical service. The new steam-electric plant and the Young's Bay gas plant, as well as the Astor Street substation, were outside the fire zone, but the local offices were burned. Virtually all the records, however, were saved.

It has been reported that the property loss of the Pacific Power & Light Company will amount to at least $175,000. The industrial district of the city was not harmed, but the entire commercial section was wiped out and no one has yet hazarded an estimate as to what the revenue loss wil be to the various utilities.

Legislature Will Consider Bus Regulation

That some effort will be made during the coming session of the Iowa Legislature to restrict the irresponsible bus competition from which city railways have suffered during the past two years seems to be a foregone conclusion. The Iowa League of Municipalities, made up of city officials from many of the cities and towns, has interested itself in the bus problem and promises to attempt some relief during the biennial session of the state Legislature which meets in the city of Des Moines early in January.

A. E. Gnagey, Mayor of Waterloo, is the chairman of a committee appointed by the league to investigate the matter and offer a solution, and he is now preparing a bill which will be introduced in the Legislature. Mayor Gnagey claims that bus owners and operators, paying only a nominal fee, have full use of city streets without any restrictions except those which apply to individual motorists. He calls attention to the fact that by establishing a "carriage rate" and not actually accepting a fare for a "within the city" haul buses have escaped taxation under ordinances governing taxicabs.

Mayor Gnagey is now drafting a bill and while it is not complete it is known that it will seek to give municipalities power to regulate buses and provide an operating tax which will compensate cities for injury to streets by the operation of buses.

Will Have Uniform Bookkeeping System

By an order of the Tennessee Public Utilities Commission, which will become effective in 1923, the entire bookkeeping system of all the privately owned gas, electric light, water works, street railways and power companies in Tennessee will be changed. The order requires all companies to keep their accounts in a uniform manner and in strict accordance with definite rules laid down by the commission. The new classification will conform with the accounting plan recently adopted by the National Association of Railroad & Utilities Commissioners.

Hydro-Radials an Issue

Construction of Proposed Lines Will Depend on Vote of Toronto Ratepayers

The ratepayers of Toronto, Ont., will vote at the municipal election on Jan. 1 on the question: "Are you in favor of the hydro-radial agreement passed by the City Council on Sept. 6, 1922?" Upon the answer given, the construction of the Toronto-Niagara Radial will be proceeded with or will be abandoned.

The agreement of July 27 provided for the building of the radial in question as a co-operative enterprise. As the Toronto *Globe* explains the matter Toronto's obligations under the adopted plan are twofold. The city agrees to guarantee bonds to the amount of $4,240,000, representing 85 per cent of the cost of a line from the foot of Bay Street, Toronto, to Port Credit, and to furnish free of cost that part of the right of way from the Humber to the terminal, which will pass over public property.

In pursuance of the July agreement the City Council, on Sept. 6, adopted a supplementary agreement, providing for the needed right-of-way. The agreement confers on the Hydro-Electric Commission, as trustee for the associated municipalities, the right to use for fifty years a strip of land 105 ft. wide extending from the Humber on the west to Morley Avenue on the east, and to construct and operate an underground line on Bay Street from the radial terminal, near the waterfront, to the City Hall.

The Bay Street tube and the tracks for an eastern entrance for radials are not to be constructed at present. According to the *Globe* nothing can be done by the Hydro-Electric Commission upon these portions of the enterprise without the express consent of the City Council, which may or may not vote the needed money should the commission propose at any future time to proceed with the work. The lease of the eastern right-of-way is a "reservation," and for the present nothing more. If no steps are taken within six years toward utilizing it in the bringing in of radials from the east the lease is then cancelled automatically.

The question goes to the people because a majority of the Harbor Commission is opposed to giving up the land needed without a direct vote of the ratepayers authorizing them to do so. The membership of the Harbor Commission consists of three representatives appointed by the city, which has provided most of the land and the money for harbor improvements; one by the Dominion Government, and one nominated by the Board of Trade. Two of the city's representatives, R. J. Fleming and Home Smith, not only object to the grant of the right-of-way as provided for by the agreement of July 27, but are of opinion that the city should own and operate the radial entrance and terminals, through the agency of the Toronto Transportation Commission, instead of entering into partnership with the other municipalities through whose territory the proposed radials are planned to run. As the *Globe* sees the matter the ratepayers must choose between the two principles—municipal co-operation and the opposite as presented in the phrase "Us for Toronto."

Paint Shop Destroyed

Thirty-One Cars Lost by International Railway in Blaze at Cold Spring Plant

Thirty-one cars were destroyed by fire and a workman was burned to death in a blaze which completely destroyed the paint shops of the International Railway, Buffalo, on the morning of Dec. 13. Prompt work on the part of the firemen prevented the destruction of the Cold Spring carhouse of the company, which adjoins the paint shops. The damage is estimated by Herbert G. Tulley, president of the International, at more than $350,000, fully covered by insurance. The cause of the blaze had not been determined late in the week and an investigation is being made by the company.

CARS DESTROYED WERE AWAITING OVERHAULING

The cars which were destroyed were in the paint shops for overhauling. They consisted of nine Peter Witt type center exit cars; eleven double end cars; three near side P.A.Y.E. cars; four interurban cars and four converted one-man cars. The building, a brick and frame one-story structure, and the equipment are a total loss and the company will be crippled for some time to come as the paint shop was being worked at capacity repairing and overhauling the company's equipment in preparation for the winter. There are no paint shops connected with any of the other carhouses in the city.

The fire was discovered shortly after 4 o'clock in the morning. Before the first battalion of firemen arrived, the entire structure was in flames. The grease and oils in the building and the high wind caused the blaze to spread rapidly and the firemen had difficulty in keeping the flames confined to the paint shops and adjoining dwellings. The main car sheds at Cold Spring, housing more than 500 cars, were not damaged in the least.

Edward McQuivey was burned to death in the fire. He was employed as a painter and night watchman. His charred body was found by firemen after the blaze was extinguished.

The company has received several letters from individuals who have threatened to fire the Cold Spring carhouse and in some quarters suspicion is directed toward strikers or their sympathizers. One attempt was made some time ago to destroy the structure by the explosion of a bomb placed on the roof of the building. Since the start of the strike on July 1, 1922, the carhouse has been under heavy police guard.

Adjournment on Car-Bus Hearings

Quick settlement to determine the result of the street car-bus franchise that was submitted to the electors of Saginaw, Mich., on Nov. 7 has been removed with an adjournment on the hearings for orders to show cause issued by the Circuit Court until Dec. 21.

The hearing on the order secured by the opponents and the hearing on the order secured by the proponents will be combined, as both measures have been consolidated. Attorneys interested in the election from both sides will fight it out through the courts.

The franchise, if carried, would have meant the resumption of street car service with motor bus extensions, but apparently it was defeated on the original returns by fifteen votes. On the recount the measure lost by fifty-seven. More than 1,000 ballots are now in dispute, the opponents having asked the courts to pass on a majority of them because of alleged technicalities. No matter which side secures the decision in the lower court, the entire question, it is believed, will be carried to the State Supreme Court for a decision.

Financial and Corporate

Extra Common Dividend Declared

At a meeting of the board of directors of the United Light & Railways Company, Grand Rapids, Mich., held on Dec. 6, 1922, the regular quarterly dividend of 1½ per cent was declared on the first preferred stock payable Jan. 2, 1923, to stockholders of record on Dec. 15, 1922. There was also declared the quarterly dividend of 1¾ per cent on the participating preferred stock payable Jan. 2, 1923, to stockholders of record on Dec. 15, 1922.

A quarterly dividend of 1¼ per cent on the common stock of the company was declared payable on Feb. 1, 1923, to common stockholders of record on Jan. 15, 1923. An extra dividend was announced of ¼ of 1 per cent on the common stock of the company payable on Feb. 1, 1923, to stockholders of record on Jan. 15, 1923.

Net Income $97,059

The accompanying table shows the results of operation by the Department of Street Railways, Detroit, Mich., for October and September, 1922.

CITY OF DETROIT

Department of Street Railways

INCOME STATEMENT AND OPERATING STATISTICS, OCTOBER, 1922, COMPARED WITH SEPTEMBER, 1922

Operating Revenue	October, 1922 31 Days	Cents per Car-Mile	September, 1922 30 Days	Cents per Car-Mile
Revenue from transportation				
Passenger revenue	$1,525,249		$1,444,326	
Parlor, chair and special car revenue	62		72	
Miscellaneous transportation revenue	1			
Total	$1,525,313	.3921	$1,444,399	.3795
Revenue from other railway operations				
Station and car privileges (advertising)	$6,772		$6,660	
Rent of track and facilities	81,557		81,867	
Miscellaneous	366			
Total	$88,696	.0228	$88,527	.0233
Total operating revenue	$1,614,010	.4149	$1,532,927	.4028
Operating expenses				
Ways and structures	$178,998		$166,398	
Equipment	97,817		89,829	
Power	157,365		149,006	
Conducting transportation	563,433		545,082	
Traffic	310		290	
General and miscellaneous	129,445		122,809	
Total operating expenses	$1,127,370	.2897	$1,073,416	.2820
Net revenue railway operations	$486,640	.1252	$459,510	.1208
Deduct taxes assignable to railway operations and miscellaneous rents	$54,573	.0140	$52,901	.0139
Net operating income	$432,066	.1112	$406,609	.1069
Non-operating income				
Net income from miscellaneous property	$1,182		$1,697	
Income from unfunded securities and accounts	15,123			
Income from sinking fund and reserves	2,960			
Total non-operating income	$19,266	.0050	$1,697	.0004
Gross income	$451,332	.1162	$408,306	.1073
Deductions				
Pro rata sinking fund provision on $15,000,000 original bond issue	$38,471		$37,747	
Pro rata reserve on D.U.R. purchase contract	143,274		142,015	
Pro rata sinking fund provision on $4,000,000 bond issue	11,324		11,111	
Pro rata interest fund provision on $15,000,000 bond issue	59,706		58,583	
Pro rata interest fund provision on $4,000,000 bond issue	14,715		14,086	
Pro rata interest fund provision on deferred payments on D.U.R. purchase contract	86,528		83,736	
Amortisation of expense on funded debt	253

Ratio of transfer passengers to revenue passengers		32.3 per cent		32.3 per cent
Revenue passengers per car-mile operated		7		7
Transfer passengers per car-mile operated		2		2
Total passengers per car-mile operated		9		9

Results Under Service-at-Cost

Youngstown Commissioner Says 300,000 More Passengers a Month Must Be Carried to Avoid Deficit

The report of an audit of the accounts of the Youngstown Municipal Railway, authorized by the City Council, has just been made to that body by H. W. Feather, the accountant employed by the City Street Railway Commissioner for the purpose. The period covered by the audit is from Jan. 16, 1919, when the service-at-cost ordinance under which the Youngstown city railway lines are operated, became effective, to Aug. 31, 1922.

Mr. Feather prefaces his report with the statement:

> The entire accounting system including that in the storeroom is exceptionally good, and the check on cash receipts is accurate and complete. Every courtesy was shown me by the officials of the operating company.

In the period covered by the audit Mr. Feather found that the gross revenue was $5,747,624, while the operating and maintenance expenses, including taxes, were $5,413,356. The latter item is increased to $5,439,387 by certain special expenditures authorized under the ordinance, leaving a balance of $308,237 applicable to depreciation and interest on capital.

The agreed capital value under the service-at-cost ordinance on Jan. 16, 1919, was $4,370,480, and the additions to capital since that time up to Aug. 31, 1922, were $98,276, making a total of $4,468,757 on which, under the terms of the ordinance, a return is to be paid, the rate on the original agreed value being 7 per cent and on the capital additions the actual cost of the money. These charges against operating income and depreciation charges, Mr. Feather's audit shows, amount to $1,162,168, or $853,931 in excess of the balance left after paying operating charges and taxes. This excess is carried as a debit balance in the stabilizing fund, the state of which fund controls the rate of fare to be charged under the service-at-cost ordinance.

In this regard, the audit report points out:

> The present physical condition of the company's property is such as to warrant the capitalization of this deficit plus any additions since Aug. 31, 1922, that portion of this deficit represented by unpaid interest on capital value bearing interest and the balance being non-interest bearing.

Mr. Feather found that the company during the period of his audit had operated a total of 13,030,069 car-miles, carrying 77,898,884 original passengers and 17,341,096 transfer passengers. Basing his calculations on the fare revenue received, he found that the average fare per original passenger was 7.34 cents, while including the items of interest and depreciation, in part accrued, the cost per original passenger was 8.48 cents.

Mr. Feather points to the falling off in the number of passengers carried and the increased cost of carrying them, due to the "unsettled business conditions with resultant labor troubles, increased cost of materials (particularly fuel), increased cost of labor and the general business depression starting early in the fall of 1920 and extending to late summer of this year." He continues:

During 1920 there were 727,626 fewer original passengers carried than during the 11½ months of 1919, and in 1921 6,136,408 fewer than in 1919. The entire year of 1922 will probably show an increase of about 3,000,000 passengers over 1921, but still fewer by 3,000,000 than 1919.

Regarding the weekly pass, Mr. Feather found that the average fare per original ride on passes was 4.97 cents. He says:

There has been a steady growth of passengers carried since the installation of the weekly pass, which was started in October, 1921. Better business conditions are probably responsible for some of this increase, but the greater part of the increase is, no doubt, due to the pass. August, 1922, showed an increase of 566,854 passengers over August, 1921, or more than 50 per cent.

Without attempting to solve the problem of the number of these passengers who would not have been carried were it not for the weekly pass, Mr. Feather comments:

Unfortunately the use of the pass has lowered the average fare per passenger to such an extent that unless the weekly pass is discontinued the company must carry 300,000 more passengers per month to avoid a deficit.

Memphis Reorganizations Progressing

The management of the Memphis Power & Light Company, Memphis, Tenn., successors to the Memphis Gas & Electric Company, and the Memphis Street Railway, will be directed by T. H. Tutwiler, executive head of the street railway, it is stated. Following the sale a few days ago of the gas property, the owners will be ready to take charge by Jan. 1. Just as soon as the details of reorganization of the gas company are completed, preliminary steps will be taken looking to the sale of the Memphis Street Railway at auction on an order of the Federal Court. The Electric Bond & Share Company, New York, contemplates the purchase of the street railway property as has been done in other southern cities and will proceed with immediate reorganization of the street railway.

Securities at Auction

Electric railway securities sold by Adrian H. Muller & Company on Dec. 6 at the Public Auction Room, 14 Vesey Street, New York, were as follows:

200 shares Albany Southern Railroad common; $11.50 per share.

100 shares Albany Southern Railroad preferred; $26 per share.

230 shares International Railway Company common, voting trust certificates; $13 per share.

$14,000 Second Avenue Railroad first consolidated mortgage 5 per cent bonds, due 1948, Guaranty Trust certificates of deposit, 1½ per cent.

$16 900 Dry Dock, East Broadway & Battery R.R. Company registered refunding mortgage income gold bonds, series C, due 1960, with $239 scrip, $600 lot.

225 shares North Jersey Rapid Transit Company, common, $7 lot.

$37,500 North Jersey Rapid Transit Company first mortgage 5 per cent bonds, certificates of deposit, $200 lot.

15 shares Nova Scotia Tramways Company, common, $100 lot.

50 shares Nova Scotia Tramways Company, preferred, $2,000 lot.

Toronto Purchase Arbitration Completed

The Toronto Railway arbitration has been concluded and the next and vital step will be the announcement of the award.

The *Financial Post* of Toronto says that surrounding this matter are the questions:

Will it be acceptable to both sides?

Will there be further litigation—an appeal to the Privy Council?

According to the *Post* there are those who contend that both sides will be anxious to avoid a further piling up of costs, but such a contention is hardly borne out by experience. The company may appeal on some questions of law, but it seems more reasonable to believe that the city, not always given to weighing the dollars and cents of the people before rushing in to spend, would be more liable to take the jump than the company. On the other hand, says the *Post*, if the award is unacceptable to the company, and especially if there is a hitch in the interpretation of a clause of the franchise, the company is certain to appeal. In further explanation of the matter the *Post* says:

During the past few years, since the wave of public ownership has hit the country, franchises and agreements have been likened more to a scrap of paper. The Privy Council, however, has been the only standby. There an agreement is respected and an interpretation on the strict letter of the paper, devoid of any sentiment, is usually forthcoming. However, both these conjectures might be termed "crossing bridges."

For the present the guessers have sufficient to conjure with in the possible award. The guesses already vary. Some place the figure between $10,000,000 and $12,000,000. The city is willing to pay around $7,500,000 and this does not include a considerable amount of the company's real estate, including the office building, Scarboro Park and the steam plant site. To this would be added the $3,000,000 which the company already has in its treasury from the clean-up deal, including interest on the award, which dates back to Sept. 1, 1921.

There is another point to consider, as to whether the city is likely to get the road at its figures with Chicago experts placing the value of the property at $20,000,000. Each side must pay its share of the arbitration cost, but it is said that the company has already set aside sufficient to care for this. An approximate cost is given as $2,000,000, and the company has a reserve on hand greater than this amount to care for such a charge. The company is to be paid in 6 per cent bonds of the city, dated Sept. 1, 1921, so that if there is an appeal, no matter by the city or company, this interest continues. Thus it can be said that on the interest alone the stock is worth 6 points more than it was a year ago. The uncertainty which surrounds the matter caused a pronounced weakness in the stock lately and a drop of about 12 points from the recent high.

Seeks Discontinuance of Line

The San Diego (Calif.) Electric Railway has applied to the State Railroad Commission for permission to discontinue service over the main portion of the Woolman Avenue line—that portion extending from Twenty-fifth Street and Imperial Avenue to the Intersection of Fifth and K Streets—a distance of about three-fourths of a mile, it is announced by General Manager Claus Spreckels. Service over that part of the line was discontinued about Dec. 1 because of the poor condition of the track, and Manager Spreckels states that service will not be resumed except under orders from the commission.

In April the company applied to the City Council for a franchise for a line on Twenty-fifth Street from K Street to Broadway, with the intention of running the Woolman Avenue cars over this route and abandoning K Street, which is closely paralleled by the Imperial Avenue line on the south and the Market Street line on the north. This franchise was granted by the Council, but with conditions added which are not in the company's general franchise and which General Manager Claus Spreckels declared he will not accept. At present residents of the Woolman Avenue district are being served by a stub operated from Twenty-fifth and Imperial, with transfers to and from the Imperial Avenue line.

Manager Collins Made Receiver

John S. Collins of Jackson, general manager of the Michigan United Railways, was named by Federal Judge Arthur J. Tuttle on Dec. 13 as receiver for his company, following filing of a petition for receivership by the Commonwealth Power, Railway & Light Company. The Michigan United Railways serves about forty cities and towns in the western and central parts of the State.

Financial News Notes

Seeks Increased Capital Stock.—The Port Arthur (Tex.) Traction Company has filed an amendment to its charter under which the capital stock is increased from $300,000 to $400,000. Under the recent order from the city to move all car tracks to the middle of the street, the company faces heavy expenditures and additional capital is needed.

Transfer of Rights Sought.—The Richmond Light & Railway Company, New York, N. Y., has applied to the Transit Commission to transfer the railroad property of the company to the Richmond Railways, Inc., and to make and transfer certain issues of securities. This is a step in the reorganization of the company now in the receiver's hands, and which was recently acquired by new interests. Permission is sought to transfer the franchises and properties comprising the electric railroad system of the Richmond Light & Railroad Company to the Richmond Railways, Inc., in consideration of receipt by the Richmond Light & Railway Company of 6 per cent 30-year mortgage bonds in the face amount of $2,000,000 and capital stock of no par value to the amount of 20,000 shares. None of the securities to be issued is to be sold. A hearing was held by the commissionon Dec. 13 and decision was reserved.

Traffic and Transportation

Reduction Not Likely

Connecticut Commission Believes Five-Cent Rate Impracticable in Large Cities—Service Satisfactory

In the opinion of the Public Utilities Commission of Connecticut the installation of a flat 5-cent or 6-cent fare without transfer privileges would not give satisfaction in large cities taking the cities as a whole. Bridgeport and Norwalk lent themselves to the adoption of reduced fare zones because of the particular geographical layout and also because of the trend of traffic. These statements were made in the annual report of the commission which was recently presented to Governor Lake.

The report covers in full electric railway operation in the State of Connecticut. The announcement of the impracticability of the 5-cent fare in Connecticut comes at a critical time when Mayor Kinsella of Hartford has announced his intention of taking up with the commission body the matter of reducing fares in his city.

The present rates of fare charged by the Connecticut Company are based upon a flat rate of 10 cents for a single cash fare with a ticket rate of 8⅓ cents or three for 25 cents. Bridgeport and Norwalk are exceptions to this schedule. They have a 5-cent zone fare without transfers. This schedule was authorized by the commission in November, 1921, for a trial period of ninety days, and thereafter until changed by the commission. The results of the eleven months' operation in Bridgeport referred to in *Electric Railway Journal* of Dec. 9 showed an increased operating income but provided an amount below what would be considered a reasonable return on the investment or fair value of the property. This condition obtained also in Norwalk. The test period expired in the early spring and the temporary order has not been revoked. The report says on this point:

> It was the hope and reasonable expectation of the commission that the ticket rates of the Connecticut Company could before now be reduced from 8⅓ cents to 7½, or two tickets for 15 cents, and at such time a proper modification of the temporary orders in Bridgeport and Norwalk might be made; but industrial depression and unfavorable weather during the summer months operated against more favorable gross and net operating revenues of the Connecticut Company.

Believing the cut detrimental the report continues:

> The commission is strongly imbued with the theory that any utility company, to give good service, must be in a healthy financial condition, and that any reduction of rates or diminution of revenues of any necessary utility, operating under efficient and economical management, which will seriously impair its financial standing and fail to afford a fair return upon a conservative valuation of its property used and useful in the service, will ultimately and surely be extremely detrimental both to the company and to the public which requires its service, and which service should be reasonably dependable and satisfactory.
>
> It may be assumed that the services of a public utility are essential for the well being of the state and for the comfort and happiness of its citizens, and that only by financially successful and carefully managed companies, as in any other line of business, can such service be satisfactorily maintained.
>
> Under public regulation there should be little chance for undue profits or discriminatory service, but any policy of regulation which will arbitrarily and without sound reason reduce utility rates or diminish the revenues to an extent that utilities are unable to pay a fair return or raise new money for necessary capital improvements, betterments and extensions, will very much diminish the power of the regulating body to compel good service.

The report says further:

> The companies are gradually increasing mileage of open track, which is to be commended, and on side location and interurban lines they are constructing earth landing places which enable passengers to be handled more safely.
>
> Automatic signals have been installed on a number of lines. This substitution of modern signal equipment for older types should be continued as extensively and as rapidly as practicable.
>
> Traffic and operative signs show considerable progress toward standardization, as advocated by us in previous inspection reports; however, a few turnouts and calling points still remain unlabelled. Highway crossing signs were found in only a fair condition of maintenance; some with broken wings or sadly out of plumb, others obscured by tree limbs which should be kept trimmed.

The report concludes by saying that street railway service on the whole has been satisfactory and that the companies, particularly the Connecticut Company, have shown better financial results and have been able to meet with some degree of success their state tax obligations.

Applies for Seven-Cent Fare Continuance

The United Railways & Electric Company, Baltimore, Md., has filed an application with the Public Service Commission for a continuation of the 7-cent fare. In discussing the application H. B. Flowers, general manager, said that almost half of the total receipts of the company were returned to the 5,000 employees in wages in the last ten months.

In commenting on the affairs of the Company, Nelson Cook & Company, bankers of Baltimore, in their December pamphlet say in part:

> There are naturally many people in Baltimore who selfishly and without reason would like to see a lower street car fare. There are many, perhaps, who would be glad to ride on the street cars without any fare. It would make little difference to them who paid the freight so long as it cost them nothing. It is against thoughtlessness of this character that the Public Service Commission of Maryland stands as a bulwark in the protection of property rights.
>
> A large Baltimore labor body is reported to have passed a resolution asking the return of the pre-war 5-cent carfare. As the United Railways Company is one of the most extensive employers of labor in Baltimore, we wonder what labor would say if the company sought to cut the wages of its employees to a point where the former 5-cent fare would be possible. Until the time comes when wages can be materially reduced and the cost of transportation correspondingly lowered our street car fare must remain at its present 7-cent rate to enable the combany to earn a sufficient sum to maintain its credit and thereby maintain public service.

Cut in Cleveland Fare Expected

As a result of a settlement between the City of Cleveland and the Cleveland (Ohio) Railway, regarding the disposition of a number of funds, it appears certain that the Cleveland car riders will receive another reduction in fare on March 1. The adjustment of funds just made involves a grand total of $986,022. This sum has been carried for several years in so-called "suspense accounts."

In the agreement between the city and the company, $476,151 is transferred to the interest fund, which is the fare barometer. Because of the transfer there was in this fund on Nov. 1, $588,522. When this total reaches $700,000 the fare is automatically reduced. There is today a large accumulation in the operating reserve surplus which must be transferred to the interest fund on March 1, making the fare reduction almost sure.

Cleveland car riders are now paying 5 cents cash fare or five tickets for a quarter with 1 cent for transfer. The next lower rate of fare is the same, except that riders may get eleven tickets for 50 cents. In view of the fact that this next lower rate of fare varies so slightly from that now in effect, it is not at all unlikely that a further reduction will be made to 5 cents cash or six tickets for a quarter with 1 cent for transfer.

In the adjustment made in the agreement between the city and company, $305,982 went to the maintenance, depreciation and renewal reserve; $82,536 to the road equipment reserve and $6,982 to the operating expense reserve.

None of the Cleveland Railway executives will be quoted as to the certainty of a fare reduction on March 1, but there is a general accord that unless there is a totally unexpected drop in business during the next few months, or some extraordinary expense is incurred, the fare will go down probably two notches on March 1.

School Tickets Reduced

According to a recent announcement of the Connecticut Company, pupils can hereafter ride at one-half the metal ticket rate instead of one-half the cash fare.

Fares on all Connecticut Company lines were reduced 16 per cent on March 1, 1922. The fare unit had been 10 cents and it was provided that three metal tokens be sold for 25 cents, at the rate of twelve for $1. Single cash fares remained at 10 cents, when tokens were not used. School children have continued to pay one-half of the 10-cent rate, buying books of twenty tickets for $1. Under the decision of the Connecticut Company directors, they will be able to buy books at one-half of the token rate, saving 16 per cent.

Books of tickets are issued to school children, when the fact of their attendance at public or parochial schools is attested by parents and school authorities.

Plan in Effect to Reduce Fares and Maintain Revenue

On Dec. 8 the San Diego (Calif.) Electric Railway started a thirty-day trial of a plan calculated to reduce fares to the street car rider and still maintain the usual revenue for the car company. The plan is fostered by an organization known as the Merchants' Transportation Coupon League, and its promoters claim that it will promote business for the merchants who are members of the league and also increase street car patronage during the hours when traffic is usually light.

In brief the plan is as follows: The company issues to the league a special red token at 7½ cents each (the regular outer zone fare in San Diego). The merchants who are members of the league sell these tokens to the public at two for 15 cents, and with each token sold give two coupons valued at 2 cents each in trade. Merchants who are members of the league accept these coupons as cash on purchases in their establishments at the rate of one 2-cent coupon for each 25 cents worth of goods purchased. Thus if the patron purchases two tokens for 15 cents for the round trip to town and back, and makes purchases at league stores amounting to $1, the coupons can be turned in for 8 cents, thus reducing the actual fare paid to 7 cents for the round trip, or a reduction of more than 50 per cent of the regular fares. The league promoters have secured 100 merchants as members of the league, representing practically all lines of business, both downtown and suburban, so street car patrons desiring to purchase the new red tokens will find them at convenient points throughout the city.

The railway company has placed the following restrictions on the use of the red tokens: They will be accepted in payment of fare only between the hours of 9 a.m. and 4 p.m., and from 6 p.m. until midnight. During the peak-load hours regular tokens must be used. No transfers will be issued on the red tokens.

Whether the plan becomes permanent or not depends upon the showing made by the thirty-day trial, it was stated by Claus Spreckels, general manager of the San Diego Electric Railway. If the expectations of the promoters are realized the plan will be made permanent.

Seeks Another Extension of Seven-Cent Fare

An application for another extension of the 7-cent fare has been made by the United Railways Company, St. Louis, Mo., before the State Public Service Commission at Jefferson City.

The commission has extended the 7-cent rate several times, the last occasion being up to Dec. 31, 1922. The application filed recently asks that the extension be granted until the commission has completed the valuation of the property of the United Railways Company now being made and has promulgated and put into effect a permanent order authorizing the collection of a fare that is predicated upon the final valuation.

In the event that the commission does not see fit to grant the extension upon those terms the petition asks that some extension at least be given.

Supreme Court to Decide

Opponents of Increased Fare in the City of Dallas Will Take Issue to Higher Court

The fight on the 6-cent fare in Dallas, Tex., will be taken to the Supreme Court, according to attorneys for those opposing the higher fare, unless relief is had in the lower courts. Joe A. Worsham, attorney for the Dallas Railway, is also preparing to take the case to the Supreme Court on a writ of error.

The case as originally brought by F. J. Geller et al. in the Forty-fourth District Court of Dallas County, sought to enjoin officials of the Dallas Railway from collecting a 6-cent fare, alleging that the city ordinance making the grant of the 1-cent increase in fare was not legally passed by the City Commission. Petitioners set forth that the franchise entered into between the city of Dallas and the Dallas Railway on Jan. 8, 1917, was a contract and bound the company to charge a 5-cent fare during the life of the franchise, unless said fare should be changed under the conditions of the sliding scale set forth in the franchise, and that therefore the city ordinance granting the fare increase was void, inasmuch as it had not been submitted to the qualified voters for indorsement at a referendum election.

John W. Pope, sitting as special judge in the Forty-fourth District Court, denied the injunction in sustaining a general demurrer filed by the attorney for the company.

The case was appealed to the Fifth Court of Civil Appeals at Dallas by attorneys for Geller et al. and on hearing before the Appellate Court the case was reversed and remanded to the District Court for hearing on its merits.

The Appellate Court held that the franchise entered into between the company and the city of Dallas was not a fixed contract, but was subject to constant regulation by the governing body of the municipality granting it; that the ordinance involved in this case was not one granting a franchise but one regulating the rate schedule; that such regulatory ordinance could not go into effect immediately because none of the exceptions creating an emergency existed; that the suspension of the prescribed method of passing ordinances was not required for the immediate preservation of the public peace, health or safety; that the declaration of the board of city commissioners declaring an emergency existed did not create such an emergency, was not binding and conclusive, but was subject to judicial ascertainment; that the emergency clause in the ordinance is void, but that the ordinance is not void, but merely inoperative until it shall have been published for the thirty days required by law. And if within the thirty days a referendum shall be demanded by the electorate of the city of Dallas in the manner provided in the city charter, then such referendum must be held and the ordinance ratified by the people before it shall take effect.

Upon this decision Joe A. Worsham, attorney for the company, announced that he would seek to carry the case before the Supreme Court on a writ of error, and this proceeding served to halt the rehearing of the case in the Forty-fourth District Court.

In the meantime the city of Dallas, through J. J. Collins, city attorney, sought and was granted authority to enter the case as *amicus curiae*, declaring that although the city was not named in the original petition, the fare case was a matter of public interest and the city should be represented in the litigation. The city entered the case to attempt to aid the street railway in showing that the 6-cent fare increase was legally granted and should be continued in order that the traction company might earn a fair return on its invested capital.

Another development following the decision of the Fifth Court of Civil Appeals was the filing of a petition by attorneys for F. J. Geller et al. with the City Commission asking that the Dallas Railway be directed to issue a fare receipt to every person paying the 6-cent fare. The petition asked further that the company be directed to set aside the money collected by reason of the fare increase so that this money might be available for refund to patrons of the company in case the 6-cent fare ordinance is finally declared void.

The City Commission referred the petition to the city attorney without action.

Seeks Permission to Charge Seven Cents

The Shreveport (La.) Railways has filed a petition with the Public Service Commission of Louisiana asking permission to charge a 7-cent fare. The company based its application upon a belief that it was entitled to earn a fair return on the fair value of the property.

The appraised value of the property, based upon reproduction on present prices less a fair depreciation, is $3,229,834. The company asks to be allowed to earn 7½ per cent on this amount above the cost of operation, taxes and depreciation. The commission now has public accountants preparing a statement of the historical value of the property.

In 1920 the people by a popular vote granted an increase from 5 cents to 6 cents. The Constitutional Convention of 1921 placed the public utilities of the state under the Public Service Commission and that commission promptly reduced the fare to 5 cents. Following this the company had the property appraised upon which it could base an application for an increase.

Personal Mention

Selling an Idea

W. B. Spencer, Assistant to President at Providence, Tells Public to Use Trolley for Business

To the general public of Providence, R. I., W. B. Spencer is just a name, like thousands of others in the telephone book or the city directory for instance. The public may not know Mr. Spencer, still all Providence is talking about him, or at least about his work, for it is he that is driving home to them by car dasher sign, newspaper ad and by pamphlet the philosophy of using the street car for business and saving the automobile for pleasure. He is getting his message across, or the public wouldn't be talking about him.

W. B. SPENCER

Mr. Spencer isn't new to the railway business in Providence. Indeed, not. He was, in point of fact, brought up in it. But he is comparatively new to that particular phase of the work he is now carrying on, for he has been at it actively only since Feb. 1, 1922, when he was appointed assistant to the president of the United Electric Railways and placed in charge of a newly organized department of publicity and public relations.

Mr. Spencer is twenty-nine years of age. He is a native of Providence. He joined the service of the trolley company in the summer of 1907, serving as office boy for the duration of the school vacation period, but liked his occupation so well that he retained his position when school reopened and attended an evening business school.

After serving several years in the electric railway business, Mr. Spencer decided in his own mind to see the business all the way through. He was then a junior clerk in the transportation department. Later, a position as night clerk in one of the carhouses was accepted, and the work here enabled him to become acquainted with the railroad man—his habits, his likes, his dislikes, etc. After gaining considerable experience there, Mr. Spencer returned to the main office of the transportation department, working as a record clerk. Still desirous of gaining more experience, permission was granted him to work after office hours as a conductor, and he thus learned at first hand the many arduous tasks that confront the man on the rear platform in dealing with the public. Later, he operated the front end of a car as a motorman, also for the purpose of obtaining experience.

Not being satisfied with these attainments, Mr. Spencer peered into the inner workings of the transportation department, and began to experiment in schedule making, and gradually worked up in this department until he was appointed chief clerk, taking charge of the making of schedules, the chartering of special cars and the handling of the details in connection with the company's transfer system in the transportation department, and, in general, assisting the superintendent of transportation.

As stated previously, Mr. Spencer was next advanced, on Feb. 1, 1922, to the office of assistant to the president, in which capacity his duties consist of taking charge of the department of publicity and public relations, and such other matters as the president assigns to him.

Mr. Cullen Re-enters Newspaper Work

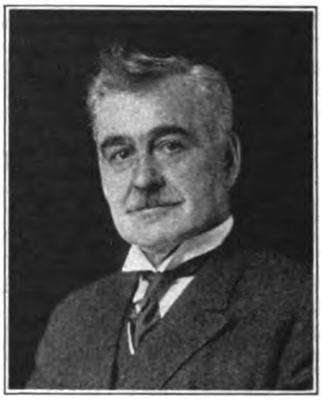
John E. Cullen, assistant to the president of the United Railways & Electric Company, Baltimore, Md., has accepted a post with the general staff of the Hearst newspapers and has gone to Milwaukee to take charge of two papers there. The announcement as made in the Baltimore *News* says that Mr. Cullen has been granted leave of absence for one year by the United. Mr. Cullen was appointed to the railway at Baltimore in 1918, in line with the policy of the company there to enlarge its staff so as to hasten the solution of the many problems created by the war. He directed his attention more particularly to the question of public regulations and publicity. He is a Baltimorean, well known as a special writer and former city editor of the *Evening Sun*. For three years before he accepted the appointment to the Baltimore company Mr. Cullen was engaged in newspaper work in New York City.

R. H. Horton, traffic engineer for the Philadelphia (Pa.) Rapid Transit Company, has been assigned to special duty in Buffalo for the International Railway and may be given a permanent position with the International, according to announcement made by Herbert G. Tulley, president of the International Railway.

William J. Clark Dead

William J. Clark, advisory manager of the railway department, General Electric Company, died at his residence in New York Dec. 13. He leaves a widow and two sons. The funeral occurred Dec. 15.

Mr. Clark became interested in electric railways in 1888, when he was instrumental in obtaining a legislative charter authorizing the construction of an electric railway between Derby and Ansonia, Conn. Shortly after he joined the sales department of the Thomson-Houston Electric Company and had been connected with that company and its successor, the General Electric Company, ever since. For part of this time he was managing director of the British Thomson-Houston Electric Company, with headquarters in London, and the acquaintance then gained and later expanded of electric railway conditions abroad made him an authority on this subject.



W. J. CLARK

Mr. Clark was a pioneer in electric railway matters in many ways besides manufacturing. He was a great student of the sociological and economic aspects of electric railroading, and in 1896, he made a valuation of the electric railway and lighting property in Milwaukee. This is said to have been the first extended physical valuation of a large electric public utility, and the general plan adopted by Mr. Clark has since been frequently followed by others. He was also greatly interested in the economic side of municipal vs. private ownership of public utilities. It was largely through his efforts that the National Civic Federation undertook its study of the subject in 1907 and he was chairman of its ways and means committee, as well as a member of the commission which made the investigation. In 1908 he acted as an expert on Cuban affairs for the War Department.

During recent years his attention had largely been given to collecting the materials for a comprehensive history on the electric railway industry.

MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Increase in Electric Locomotive Orders

A recent survey of the locomotive department of the Erie Works of the General Electric Company discloses the fact that at the present time there are a larger number of orders from different customers than has been the case at any time since 1914. Many of these customers have electrification projects under way in various parts of the world, and it is evident that interest in steam railroad electrification has been greatly stimulated by the high prices of fuel, labor and commodities.

Domestic orders include two 120-ton electric locomotives for handling increased business over the Baltimore & Ohio Belt Line, which was electrified by the General Electric Company in 1895. Another order has been received from the Sacramento Northern Railway in California for two freight locomotives to be used in heavy interurban freight service.

Among foreign orders are contracts for locomotives to be installed in Spain, France, Chile, Japan and Mexico. A Mexican order including ten 150-ton, 3,000-volt direct-current locomotives is the first electrification in that country. The equipment will be installed for the Mexican Railway on the Mexico City-Vera Cruz Line and is expected to effect sufficient economies to pay for the entire equipment in a period of five years.

The six locomotives for the Spanish Northern Railway, also to be operated at 3,000 volts direct current, are nearly completed and will be in operation early next year. These will be called upon to handle both freight and passenger service over a heavy grade section and will be the first installation of 3 000 volts direct current in Europe.

As part of a large order for electrification equipment the Paris-Orleans Railway has under construction at the Erie Works of the General Electric Company a high-speed gearless passenger locomotive, which will be tried out on the initial electrification in France. In Chile, the Bethlehem Chile Iron Mines Company has purchased three 60-ton switching locomotives for hauling ore out of the Tofo mines. These will operate at the mines from a 600-volt trolley, but will haul ore to the bins from which it is taken to the port of Cruz Grande over the present 2,400-volt direct-current line. The Imperial Japanese Government had laid out an extensive program of electrification on the so-called Tokaido Railway using 1,500 volts direct current. Trial orders have been placed for locomotive equipment, and the Erie Works of the General Electric Company has recently shipped two 66-ton locomotives, which will be temporarily operated on the present 1,200-volt electrification pending the purchase of additional equipment for the electrification of those lines which at present are steam operated.

There are numerous indications that a greater interest in electrification is being developed in the United States, and it is predicted that within the next few years extensive work will be done in electrifying the main-line roads of this country.

Largest Street Railway Adopts Meters

The Chicago Surface Lines has placed an order with the Economy Electric Devices Company for Economy watt-hour meters to equip the entire system of 3,000 or more active cars. The order is for immediate delivery. The meters will be complete with energy saving and car inspection dials.

Metal, Coal and Material Prices

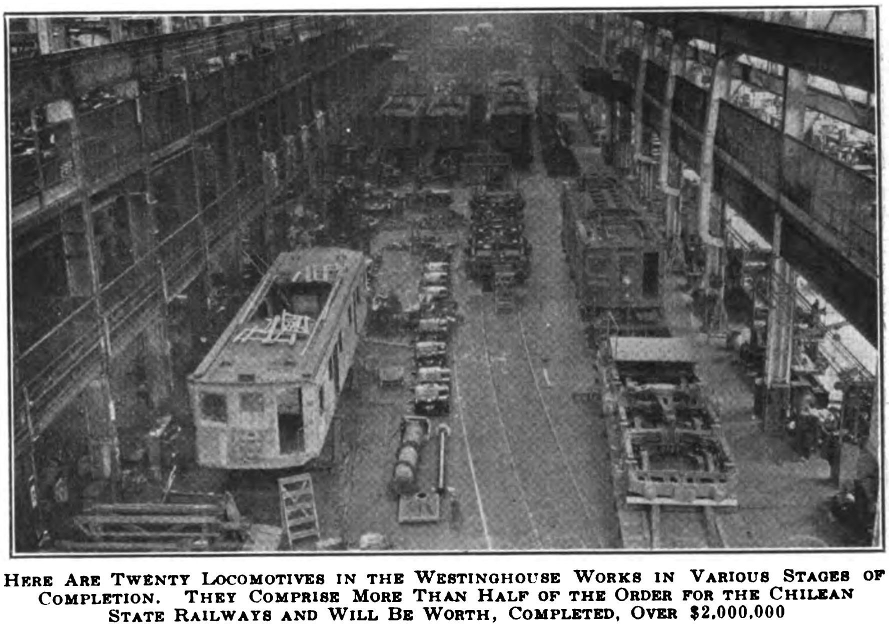
Metals—New York	Dec. 12, 1922
Copper, electrolytic, cents per lb.	13.95
Copper wire base, cents per lb.	15.625
Lead, cents per lb.	7 10
Zinc, cents per lb.	7.35
Tin, Straits, cents per lb.	37.00
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$7.50
Somerset mine run, Boston, net tons	3 875
Pittsburgh mine run, Pittsburgh, net tons	2.625
Franklin, Ill., screenings, Chicago, net tons	2.375
Central, Ill., screenings, Chicago, net tons	1.675
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No 14, per 1,000 ft	6.50
Weatherproof wire base, N.Y., cents per lb.	16.00
Cement, Chicago net prices, without bags.	$2.20
Linseed oil (5-bbl. lots), N.Y., cents per gal.	90.00
White lead, (100-lb. keg), N.Y., cents per lb.	12.125
Turpentine, (bbl. lots), N.Y., per gal.	$1.395

Electrification Work Started

Work has been started by the Texas Interurban Company, Dallas, the corporate name of the company that will electrify the line of the Missouri, Kansas & Texas Railway from Dallas to Denton and operate it as an interurban line. The work of electrifying will go forward as rapidly as possible, according to Richard Meriwether, vice-president of the company and in charge of construction work. A crew of fifteen men has been put in the field digging holes for poles along the track of the steam railway. Mr. Meriwether said the entire electrification project, which is expected to cost approximately $1,500,000 will be completed by August, 1923, and cars started.

The route of the new line from Love Field into Dallas has not been selected, and will not be selected before Dec. 14, Mr. Meriwether said. The traction company will build its own line from Love Field into Dallas, a distance of about 5 miles, and the new line will connect either with the Oak Lawn line on Cedar Springs Road or with the Lave Avenue line at Lake and Oak Lawn Avenue. The mileage in either case is approximately the same and one route is just about as direct in its entry to the business district as the other.

The company has also placed a crew of engineers in the field for surveys of the route of entry into the city of Denton. B. R. Brown and S. R. Fowler, in charge of engineering crews, have made all necessary surveys and have located a depot site in the heart of the business district at Denton. The Denton County Commissioners' Court has also granted a fifty-year franchise for the electrification of the line and the operation of interurban trains over any part of the lines of the Missouri, Kansas & Texas Railway, in Denton County from the Dallas County line to the corporate limits of the city of Denton. A similar franchise will be granted by the Commissioners' Court of Dallas County.



Here Are Twenty Locomotives in the Westinghouse Works in Various Stages of Completion. They Comprise More Than Half of the Order for the Chilean State Railways and Will Be Worth, Completed, Over $2,000,000

Rolling Stock

Glendale & Montrose Railway, Glendale, Calif., expects to furnish new modern cars in line with its complete rehabilitation of the property.

International Railway, Buffalo, N. Y., lost thirty-one cars in a fire which destroyed the Cold Spring paint shop on the morning of Dec. 13. The cars destroyed consisted of nine Peter Witt type center exit cars; eleven double-end cars; three near-side pay-as-you-enter cars; four interurban cars and four converted one-man cars.

Public Service Company, San Antonio, Tex., has placed orders for fifteen new one-man cars to cost approximately $100,000, according to announcement by E. H. Keifer, general manager. Contract for purchase of the equipment was signed Nov. 25 and calls for the first delivery on cars eight weeks from that date. The new cars will be put in service in speeding up traffic in carrying out the traction company's agreement with the city in connection with the city's curtailment of the operation of jitneys in competition with street cars.

Boston (Mass.) Elevated Railway has given an order to the Westinghouse Electric & Manufacturing Company to furnish thirty motor and control equipments for cars. Each equipment will include four Westinghouse Type 508-A motors with helical gearing and Type K-71 controllers. The cars, which are practically duplicates of those purchased by the railway last March, are being built by the Laconia Car Company and will be equipped for operation from either end. Work on the equipments has been started at the East Pittsburgh Works of the Westinghouse Company and shipment will be made about February, 1923.

Sandusky, Norwalk & Mansfield Electric Railway, Norwalk, Ohio, has purchased two gasoline rail cars from the American Railway Motor Car Company, Elyria, Ohio. These cars will be operated over the interurban tracks connecting Norwalk and Shelby, Ohio, a distance of 30 miles. The new cars will seat 40 passengers and weigh 13 tons. They are to be equipped with Midwest engines, and will have Timken roller bearings for the journals and a new type of transmission recently patented. The present owners of the railway bought it at a small fraction of its original cost, and are said therefore to have an opportunity to operate profitably.

Track and Roadway

Philadelphia (Pa.) Rapid Transit Company, through President Mitten, has submitted to the Council ordinances for three proposed new trolley routes connecting the Frankford section with Germantown and Nicetown.

Northwestern Ohio Railway & Power Company, Oak Harbor, Ohio, is constructing about 5 miles of new track around the Kelley Island Lime & Stone Company's plant near Lakeside.

Gulfport & Mississippi Coast Traction Company, Gulfport, Miss., will extend its curves at Fourteenth Street and Twenty-first Avenue and Fifteenth Street and Twenty-first Avenue.

Public Service Railway Company, Newark, N. J., has begun the work of raising 1,000 feet of track on Lafayette Street, Riverside, N. J. The company and the Burlington County authorities planned to eliminate the Fairview Street and Pavilion Avenue crossings on both sides of the railroad by repairing Lafayette Street.

Pacific Electric Railway Company, Los Angeles, Calif., was given permission by the commission to make track changes in the City of Long Beach. The company plans to relocate its crossing across the tracks of the Los Angeles & Salt Lake Railroad at Alamitos Avenue and Broadway, to construct an additional track, and to relocate tracks across Alamitos Avenue and across the intersection of Olive Avenue and Broadway.

Power Houses, Shops and Buildings

United Electric Railways, Providence, R. I., is taking figures for the construction of its new carhouse on North Broadway, East Providence. The structure is to be one and two stories high, 535x170 ft., of brick and steel. C. R. Makepiece & Company, Providence, are the engineers.

British Columbia Electric Railway, Vancouver, B. C., is preparing to build a new substation on Bodwell Road to cost about $65,000. It will probably be ready in six months. This station will be of the latest type. It will supply direct-current for railway purposes in the South Vancouver district.

Louisville (Ky.) Railway is planning the erection of a large new office building and interurban station, work on which will probably start within three or four months. This station will house the offices of the company and its subsidiary, the Louisville & Interurban Railway, as well as the interurban lines operating out of Louisville, including those into southern Indiana operated by the Interstate Public Service Company.

Trade Notes

A. A. Heller has taken over the management of the International Oxygen Company, in place of L. W. Hench, secretary and general manager, resigned.

Locke Insulator Company, Victor. N. Y., has been awarded the order for insulators on the Paris-Orleans (France) Railroad 150,000-volt electrification. It is understood that this is the largest insulator order that has been made in ten years.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., announces a change in the addresses of the St. Louis and Los Angeles offices. The former office is now located at 717 South Twelfth Street, St. Louis, and the latter at 420 South San Pedro Street, Los Angeles.

Monroe Brass & Wire Company, Cincinnati, Ohio, announces the death of its manager, J. Sumner Monroe. The business conducted by the late J. Sumner Monroe was incorporated under the laws of the State of Ohio Oct. 6 as the Monroe Brass & Wire Company with L. D. Whitcomb as president and general manager.

H-E Supply Company, Chicago, Ill., has been organized with offices at 945 Monadnock Building by J. W. Himmelsbach. The company will handle the products of the United Boiler, Heating & Foundry Company of Hammond, Ind., which manufactures steel tanks, steel stacks, breeching, light structural steel work, United traveling grate stokers and accessories and repair parts for all types of automatic and hand-fired stokers. Mr. Himmelsbach is known to the electric railway field for his connections with the Green Engineering Company, of which he was formerly district manager in Chicago, and with the Johnson Fare Box Company.

New Advertising Literature

Locke Insulator Corporation, Victor, N. Y., has issued an eleven-page booklet entitled "Strain Insulators for Guy, Dead End and Anchor Service."

Gould Coupler Company, New York, N. Y., has issued a descriptive booklet describing its type B and C slack adjusters. Drawings are given of the applications of these brake slack adjusters to late designs of cars, including one-man types.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued a twenty-page booklet, folder 4506, entitled "Salient Facts on Silent Gears." This is issued in order to acquaint the industrial gear user with the advantages of Micarta gears. The booklet describes the advantages of the use of Micarta gears and pinions and gives photographs and data describing some of their applications, tables of gear data, etc., enabling the gear user to judge whether or not they are applicable to his machinery.

Economy Electric Devices Company has recently published an interesting circular which is available for electric railway men, setting forth what may be accomplished by the substitution of aluminum field coils for copper. In this circular it is pointed out that as much as 1,500 lb. can be saved on some interurban equipment and up to 1,000 lb. on some city equipment by using aluminum coils. The technical aspects of the aluminum coil are quite clearly and fully set forth. Quite a considerable number of these coils are now in use on some forty electric railways.

How Shall Stranded Wire or Cable Be Specified?

ONE of the knottiest little problems now confronting power distribution engineers is to settle upon some standard way of specifying the sizes and types of stranded wires and cables. The American wire gage provides for solid wires through practically the entire range of commercial requirements. Unfortunately, when expressed in circular mils, the areas all come out in odd numbers, but there are fairly good reasons for the use of the present gage sizes in the "A.W.G." The most important of these is the difficulty that would be occasioned by any attempt to change them.

The situation is quite different once the "A.W.G." boundary is passed. For convenience in handling, conductors larger than No. 0000 must be stranded. There is as yet no general agreement as to how the sizes of these conductors should be specified, that is whether their sizes should be stated in terms of total circular mils of cross-section or in number of strands of wires of the standard gage. Obviously the same total area can be secured with the use of a variety of strand sizes; the greater the number of strands the more flexible being the cable. If a given total area is specified, there must be a certain latitude or tolerance permitted the manufacturer, because otherwise he would be obliged to draw special sizes of strand.

The purchaser of a stranded wire or cable has essentially to specify the number of strands, as well as the area, to secure the current-carrying capacity which he desires combined with the required flexibility. It would therefore seem desirable to make up the standard specifications on the basis of the number of strands and sizes of strands. For each approximate total area there could be a sufficient variety of stranding to meet commercial needs in regard to flexibility. For the convenience of purchasers, the approximate size of each stranded conductor could be given in the tables.

The Inductive Interference Problem Can Be Solved Only Through Co-operation

ONE of the subjects assigned to the Engineering Association committee on power distribution this year is that of "inductive co-ordination." This relates to the harmonizing of differences in regard to the phenomena long and unfortunately grouped under the term "inductive interference." This committee ought to be able to foster the spirit of co-operation suggested by the comparatively new but generally acceptable term "inductive co-ordination," a spirit which is in every way preferable to the conflict suggested by the older term.

The accepted use of the term "inductive co-ordination" in itself indicates that a marked change in attitude on the part of leading engineers is taking place. This more constructive approach to the problem should be disseminated to the men all through the utility fields, by means of such works as the report of this committee. All public utilities must co-operate along engineering lines if they are to furnish their maximum of public service. Of course, where electrical transmission forms an important part of a public utility service, there is always a likelihood of what has been known as "inductive interference." This must be controlled, and as no one utility can monopolize the ether, each must be willing to go to a reasonable expense to insure the safeguarding of its own service as well as the protection of its neighbors.

Beyond the direct advantage to the utilities in getting together, there is the further advantage that all public utilities will receive greater consideration at the hands of public utility commissions if it is understood that efforts are being made to settle differences along sound technical and economic lines. Among themselves utilities may have differences of opinion as to details and even as to principles. As a whole, however, they should present a united front, for it is enough that a commission should have to adjudicate the relations or differences between public and utility. It should not have to be called upon to settle differences of one utility with another.

Discontinuance of Tax-Exempt Issues a Benefit to All

MANY of those strongly in favor of the proposed constitutional amendment to stop the issue of tax-exempt bonds doubt whether it will ever pass, because they think the smaller and less populous states will be unwilling to give up the present privilege enjoyed by themselves and their subdivisions in issuing these securities. They point out that in the decision on a constitutional amendment of this kind, Idaho or Florida, for example, has as much voice as New York or Pennsylvania, although in these latter states the corporations which would indirectly benefit from such an amendment and the individuals who are now escaping a great deal of state taxation because of the exempt securities are much more numerous. As the less populous states are now selling their securities to citizens of the more populous states at far lower interest rates than would be possible if the amendment was in force, it is believed that it will be very difficult to get enough of them in line to pass the amendment.

It is to be hoped, however, that further discussion of the subject will indicate to the representatives of these states that their gain from such an amendment will be in equal if not greater ratio than that of the more populous and industrial states.

In the first place, it is not difficult to point out, as was done in the debate in the House this week, that the practical effect of the present amendment is gradually to exempt from taxation the very wealthy and to increase the taxation on those of moderate income. This is a matter which is a serious one to all states alike, but as the people of great wealth are most likely to reside near the large industrial and economic centers of the country, the exemptions to the federal income taxes would be much more numerous in the Eastern and Central states than in the states farther west or south. This should mean that the practical effect of the opposition of an agricultural or mining state to the amendment is to assess on its inhabitants a greater portion of federal taxes to the extent that the very wealthy who are largely residents of other states escape taxation.

So much for the individual side of the question. Another point is the corporation side, and the effect on the country at large of a lessening of corporation activity as a result of the present policy. While the large industrial corporations usually have their financial offices in the older states, their fields of activity must be largely among the states requiring greatest development, whether their purpose is direct development like railroading, mining and power, or indirectly as in manufacturing equipment for these purposes. Here again is a place where the interests of the less populous states seem at least proportionately to be as great in the proposed amendment as the more populous states.

Lower Turnover of Trainmen Favors Better Merchandising

IT USED to be said that one big reason why it was hard to train platform men to be courteous was that they did not look upon their railway job as a lifework; that most of them were on the cars only until such time as they could get back to their trades. Therefore, they did not have the necessary incentive to take pride in their work.

Today matters are much better as regards turnover in the platform ranks. The motorman and conductor are paid a wage which relatively is so much higher than before the World War that there is no longer the old desire to quit at the first opportunity. One may say that such attractive outside opportunities are much fewer. The union itself also finds its interest served by making the men feel that they have permanent and not temporary occupations. One may say then that the casual character of platform work has largely disappeared.

At the same time, none of us should be satisfied that the platform man has improved as fully as is possible in those requisites that should go with an employee who so nearly is the personal representative of the company to the patron as he is. The principal task is to secure a greater degree of courtesy. On the average property, there is still a great field for improvement in developing the attitude of mind of both motorman and conductor that the passenger is their personal customer. Some railways have really accomplished something along this line, but the observations of the *Journal* editors are that the customer still gets pretty shabby treatment on many systems.

The problem is largely one of "selling" the trainmen the merchandising principles, and this task must start with the management. It can be followed up by the superintendents, but the spirit of the thing must emanate from the big boss.

Another point in this development of the merchandising atmosphere is that the conductor might be authorized under certain conditions to refund the fare, making report of each such transaction. Perhaps this would appease the ruffled customer in some circumstances and turn his antipathy. Suppose such a policy did cause the loss of a few nickels a day, would that not be insignificant if the practice was found to help in winning friends, or in keeping from making enemies?

Our Heads Are Coming Out of the Sand

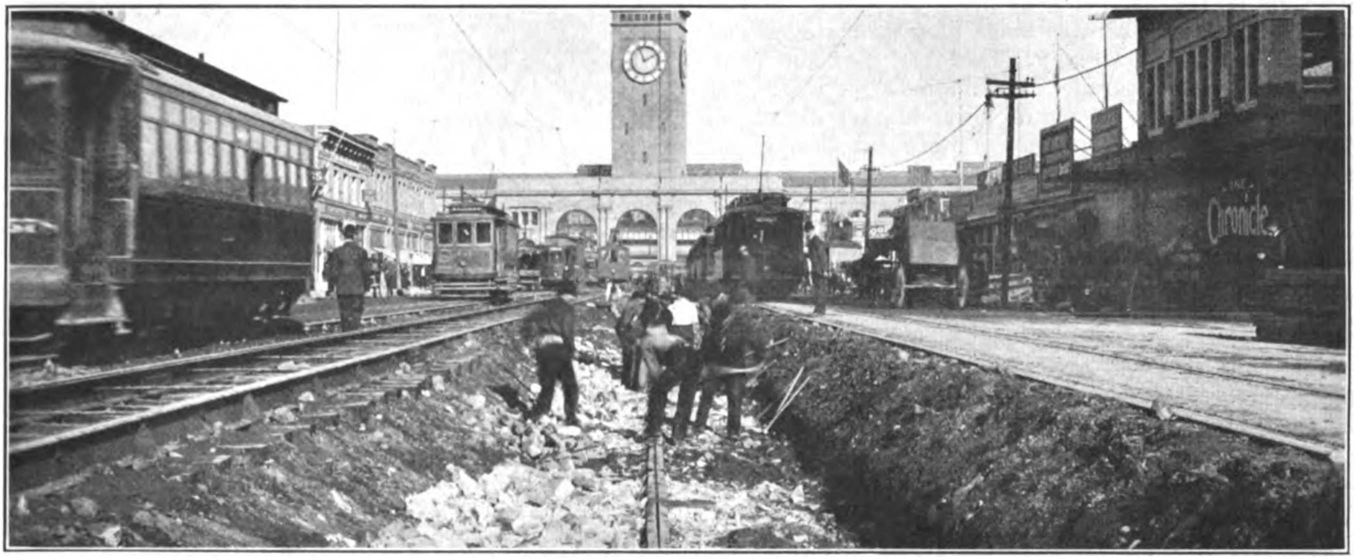
EVIDENCE is plain and plenty that a change of heart and mind is rapidly taking place with respect to the attitude of railway men toward the bus. Several of those who so vigorously opposed admitting bus companies to the transportation counsels of the American Electric Railway Association have already come to question the wisdom of their stand. There was a great tendency on the part of many of the important executives of the railway field to fight the bus, to have nothing to do with it themselves as a transportation tool. But several of these same men have since taken up operation of buses as adjuncts to their rail lines.

It has taken less than a year for them to grasp the fact that they must take hold of the bus. They must, because the public demands buses. They must because it is good transportation business to take care of the demand for a kind of service beyond that supplied by the rail lines. They must do it because there are places where the bus is economically the right form of vehicle. They must, anyway, whether altogether profitable or not, as a means of protecting present rail investment and maintaining their monopoly (which is sound principle from the public viewpoint) so that the bus service may be co-ordinated and helpful, not competitive and destructive. Let no one get the idea that the bus will replace the railway. The point is that the railway man must use the bus as well as the rail car in his business.

These comments are made not because of the opportunity to say "we told you so," but rather to bring out the fact that it now seems clear that those who took the position that buses should be used, and bus companies should be in the association, were right. The important thing now is not the error made (and it is being considered such, more and more), but to recognize the mistake and to revise the kind of thinking that has been going on while there is still time for constructive thinking to make the most of the bus—to avoid its potential destructiveness if its coming is unguided.

Why not give consideration again to an amendment of the American Association constitution to permit membership of the stable, legally recognized bus companies, as an early step toward harmonizing interests and avoid cut-throat fighting? Certainly, from the standpoint of helpful value to the bus transportation company, the American Electric Railway Association has much more to offer than any strictly bus association has now or will have for several years to come, provided the railway members really take a helpful and not antagonistic attitude. It would be to the best interests of the railways selfishly to do this.

The *Journal*, as one of the earliest advocates that railway men should make use of the bus and that bus companies should be taken into the association, feels that its position has been justified. And also, inasmuch as so many railway men were at first antagonistic toward the bus and objected to discussions of it in the *Electric Railway Journal*, the wisdom of satisfying that feeling but at the same time carrying on the educational work with both railway men and independent bus men by publishing a separate bus paper (*Bus Transportation*) may now be better appreciated.



RAISING LOWER MARKET STREET TRACKS AFTER THE FIRE
Three tracks raised and in service at new grade. The grade prior to raising is indicated by slot in old cable track not yet replaced by new construction.

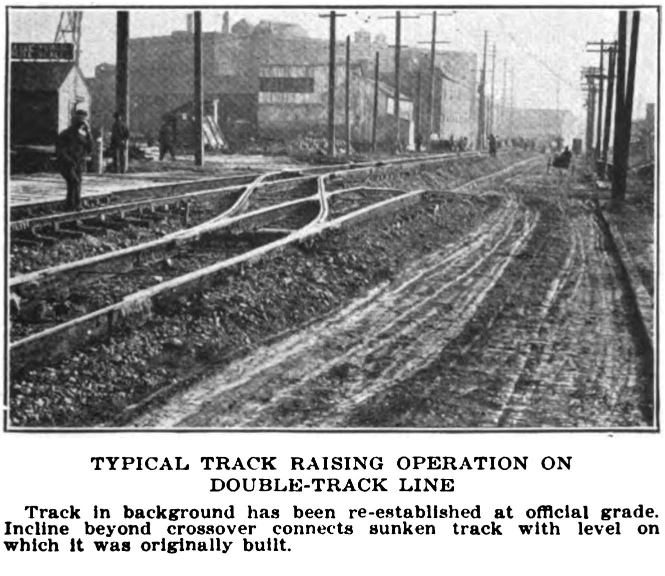
Maintaining Continually Sinking Track

Nine Miles of Track in San Francisco Settles at the Rate of 0.1 Ft. per Year—Permanent Types of Construction Are Held Inadvisable—Methods Used for Restoring Grade Are Described

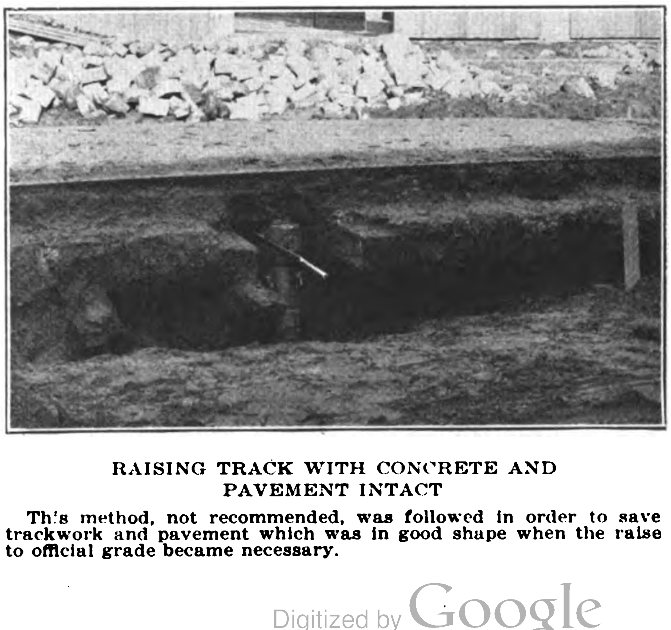
YEARS ago the shore line of San Francisco Bay extended a mile or more inland from its present location along parts of the San Francisco waterfront, but as the city developed the tide flats and shallows have been filled in so that much of the waterfront is now on filled land. The material used in making the fills has been of good quality, but the filled area has nevertheless continued to settle year by year because of the great depth of underlying soft mud. In the construction of the Southern Pacific Building on lower Market Street piles 125 ft. long were used and for this depth only soft material was encountered. All large structures in the filled area are built on piles, which support them at an established grade, while the streets continue to settle, thus making the situation worse than if structures and streets settled alike. Some of the problems brought upon the street railway by this condition and the methods of meeting them are described in this article.

The Market Street Railway operates some 9 miles of track in the areas subject to settling and has found that the rate of subsidence is fairly uniform, being about 0.1 ft. per year. This has necessitated entire reconstruction of the tracks at intervals. Fortunately, in practically all of the areas affected the electric lines operate on double tracks, thus making it possible to avoid interruption to service by operating short portions as single-track lines during reconstruction.

All of the tracks east of the old shore line, as shown on the accompanying map, have been rebuilt since the fire of 1906; some of them have been raised twice in that time. Frequently a subsidence of 3 ft. and sometimes as much as 5 ft. occurs before the grade is restored. In 1911 the track on Third Street was brought



TYPICAL TRACK RAISING OPERATION ON DOUBLE-TRACK LINE
Track in background has been re-established at official grade. Incline beyond crossover connects sunken track with level on which it was originally built.



RAISING TRACK WITH CONCRETE AND PAVEMENT INTACT
This method, not recommended, was followed in order to save trackwork and pavement which was in good shape when the raise to official grade became necessary.

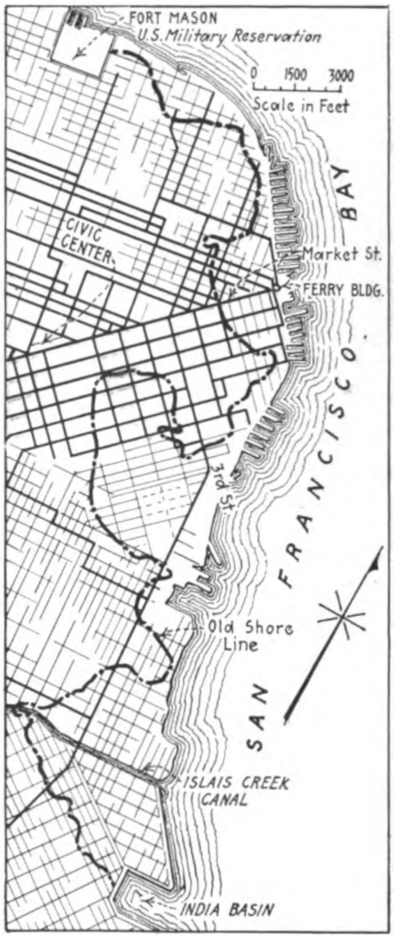
up to grade, the lift being as much as 5.35 ft. at the lowest point. The fill was made of good material and compacted in the usual way. This track has now sunk 1½ ft. below official grade. In sinking a pit which the company recently put down on lower Market Street, no less than five sunken pavements were cut through in excavating to a depth of 10 ft.

For this continually settling foundation the only method believed to be generally satisfactory is the entire reconstruction of the track at appropriate intervals. The practice is to allow the track to settle without any endeavor to maintain or otherwise improve its condition until the time comes for entire reconstruction. In reconstruction the pavement is removed, rails and ties are taken up, and the material used for making the fill is dumped on top of the old ballast. New ballast is provided and old or new rails and ties, if required, are then laid. A finished height of about 2 in. above the official grade is usually made to allow for the immediate settlement.

In one notable case the track and paving were raised intact. This was done to save the paving as reconstruction became necessary at a time when track and paving were in good condition. This method is not recommended. The process is slow and comparatively costly, but a still more serious objection is the impossibility of tamping the fill thoroughly from the sides of the raised track.

Track with paving intact jacked to the new grade is shown in one of the accompanying illustrations. In this case a "permanent" form of track construction had been used—basalt blocks on top of concrete extending down to the bottom of the ties. In raising this track, trenches were first dug along either side of the track and 20-ton jacks were placed against the under side of the rail flanges at intervals of about 20 ft. As new material was shoveled under the raised track it was tamped horizontally from both sides, using 4-in. x 4-in. timbers fitted with handles.

Because the subsidence is at a slow and uniform rate, fairly accurate prediction can be made of the time when a maximum permissible separation of street and building grade will be reached. Endeavor is made to program track and paving work in such a way that as this time approaches no work will be necessary and when the street is regraded new paving and perhaps also new rails can be put down without economic loss. Under these conditions it is considered economical not to use a permanent and expensive type of rail foundation such as concrete, steel ties, etc. A short length of track built on trestle has been found most unsatisfactory. The trestle keeps the track at grade satisfactorily, but the paving (basalt blocks are used in that district) is continually sinking away from the track and requires to be removed and replaced on new ballast about once a year. The use of planks over the stringers to support the paving has been considered inadvisable because of the renewal costs on the planking and because there would still be the subsidence of the remainder of the street to make a continually increasing abrupt change of grade on either side of the track. The trestle itself is a necessity to maintain exact grade for the approach to a lift bridge. Some of the typical grade subsidences are shown in the accompanying profile. Lower Market Street, which was restored to grade in 1907 by raises of as much as 2.86 ft. in some places, is now 1 to 2 ft. below grade again. Lower Clay Street was brought up to grade in 1908 by raises of 2 to 3 ft. and was again required to be raised a foot or more in 1920.



MAP SHOWING AREA THAT IS SUBSIDING

All that area between the bay and the old shore line is sinking at the rate of 0.1 ft. per year. Most of this has a soft mud bottom of great depth.

In these soft-bottom areas where the tracks cross sewers or culverts supported rigidly on piles conditions

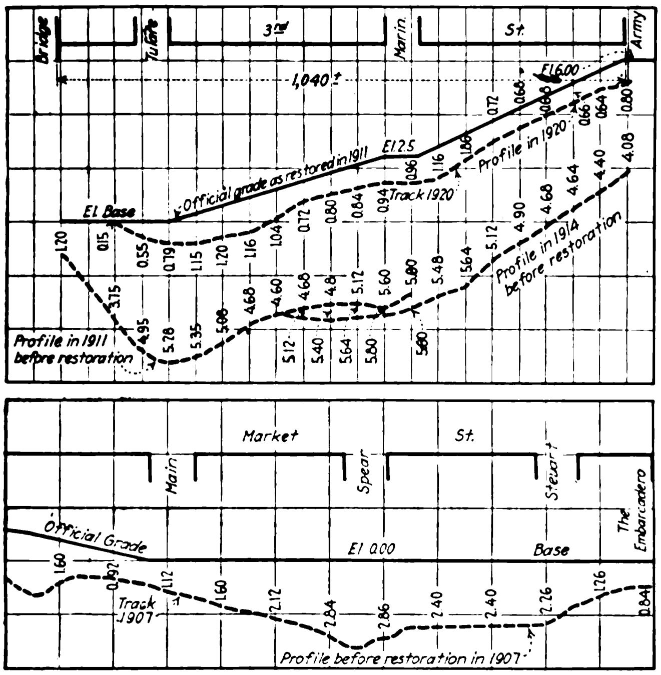
RECONSTRUCTION OF CABLE TRACK IN SERVICE

This track has been raised and back-filled. The difference in level between track and remainder of the street, which has yet to be filled, shows amount of raise, which has been necessary to compensate for the subsidence.

UNITED CIGAR STORES COMPANY

RECONSTRUCTED CABLE TRACK READY FOR CONCRETE

Note the yokes spaced 3 ft. 6 in., which take the place of ties. Wooden forms are built around these yokes for the concrete placed in final construction stage. This track indicates the restored street grade to which remainder of the street will be raised.



SUBSIDENCES ON THIRD STREET AND ON LOWER MARKET STREET

These are typical profiles. In the case of lower Market Street the tracks are now well below the official grade again.

are introduced that cannot be easily remedied. In one case where the tracks cross a box culvert the subsiding ground on one side of the culvert allowed the track to go down until a difference of 1 ft. in elevation developed within a distance of 20 ft., the rails bending to allow the track to conform to this change. Operation over the track in this condition has continued for about five years.

In another case where a concrete sewer 10 ft. wide underlies the tracks lengthwise, so that part of the tracks are rigidly supported and other parts are on settling ground, uneven settlement has caused the inner ends of the ties on both tracks to rise 2 to 3 in., while the outer ends have sunk an equal amount, thus tilting the tracks away from each other.

CABLE LINE SETTLEMENT CORRECTED BY RAISING STRUCTURE

Re-establishment of grades on the cable lines is quite a different process from that used for the electric lines. The cable railway track is supported on steel yokes embedded in concrete; a construction which could be rebuilt only at prohibitive costs. It has been found possible to raise this structure bodily, however, and as the cars are light the raising is done without interrupting operations. The narrow gage (3 ft. 6 in.) and the fact that heavy equipment is not used make it possible satisfactorily to tamp the back-fill from the sides. Sand is used largely for the back-fill and is kept wet during the tamping. When the side trenches are refilled they are also thoroughly tamped.

In order to avoid danger of cracking the concrete, the cable tracks are raised in sections of not less than 200 ft. After excavating side trenches 10-ton screw jacks are placed at 8-ft. to 10-ft. intervals under shoulders of the yoke or under the concrete bottom, as may be more convenient. The jacks are rested on pieces of old ties sewed up for this purpose. The first lift is made at least 100 ft. from one end of the section to be regraded, and the maximum lift is kept at this point until jacks are placed for 100 ft. or more in either direction and the desired grade at this central point has been reached with an easy slope in either direction. Work is then advanced in one direction only, always keeping an easy grade ahead of track that has been restored to grade.

The gangs raising cable track consist of about fifteen men and will ordinarily raise about four blocks of single track per month. A track raise of 3 to 4 in. per day has not been found to be detrimental to the concrete of the cable duct. The cable tracks are usually finished 2 in. above the official grade.

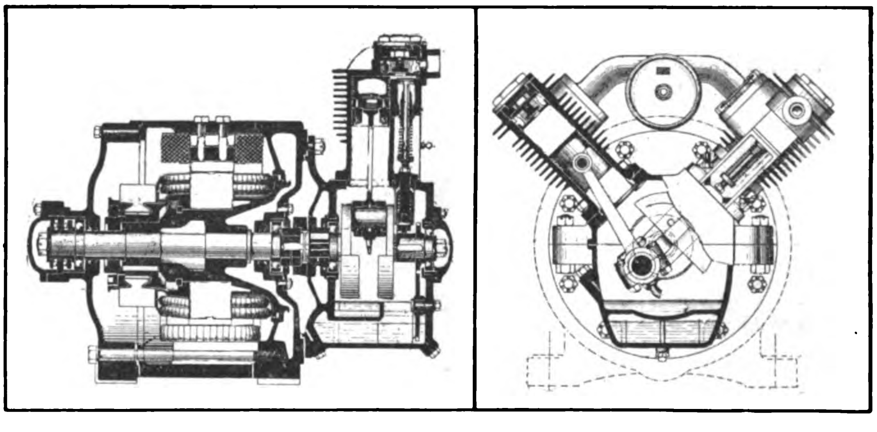
B. P. Legare, from whom material for the foregoing was obtained, is engineer of maintenance of way and construction of the Market Street Railway and has been in charge of all track work done since 1907.

A Light-Weight, High-Speed Motor Compressor

THE department of studies of the unified transportation system in Paris (la Société des Transports en Commun de la Région Parisienne) is attacking several fundamental problems of urban transportation. This was illustrated in the article on an experimental light-weight car appearing in the issue of this paper for Dec. 2. Another result of the researches of this department is a light, high-speed, direct-connected motor-compressor, weighing complete about 420 lb. The accompanying illustrations show the general construction.

The compressor is driven by a 2½-hp., four-pole series motor, operating at full load at 1,100 r.p.m. Its armature runs in ball bearings. The ends of the motor casing are of aluminum.

A flexible coupling connects the motor with the compressor, which has two cylinders, one 2½ in., the other 3½ in. in diameter. These are arranged in "V" at right angles to each other. The inlet valves are controlled by a cam carried on the main shaft. Like the motor shaft, the crankshaft of the compressor is carried in ball bearings. It is claimed that the new compressor is 20 per cent more efficient than a compressor of the low-speed type and 30 per cent lighter. An extended illustrated description of the motor-compressor will be found in a recent issue of *L'Industrie des Tramways, Chemins de Fer et Transports Publics Automobiles.*



LONGITUDINAL SECTION AND CROSS-SECTION OF EXPERIMENTAL MOTOR-COMPRESSOR FOR USE ON TRAMWAY CARS IN PARIS

Budget Control in Boston

All Expenditures Are Controlled by a Budget Prepared Every Six Months and Semi-Annual and Monthly "Controlling Sheets" Are Used in Order to Check Expenditures

ALL expenditures on the Boston Elevated Railway both for capital and operating accounts are controlled by a budget which has proved very satisfactory to the company, one reason being that it enables all operating departments to plan and conduct their work systematically and consequently with the greatest real economy.

For the operating budget the year is considered as a whole and no false feeling of prosperity or of disappointment is caused when the monthly earnings go up or down from perfectly natural causes. This means that the work can be planned more carefully and when once undertaken does not have to be stopped suddenly at considerable loss.

An article on the forms and classification used in the preparation of the Boston Elevated Railway budget, written by E. M. Flint, assistant to general manager, was published in the issue of this paper for Dec. 25, 1920. The present article will describe methods followed in the preparation of the budget and how the expenditures are checked and controlled. A tentative operating budget is prepared in June and December containing an approximate estimate of the receipts and expenditures for the six months of the following half-year period. In the preparation of this tentative six-month budget the estimated gross earnings are based on the figures for the corresponding period of the previous year with allowances for expected increases or decreases in traffic, changes in fares, etc., and the estimated expenses are based on information secured from the operating departments as to their requirements, taking into consideration wages paid, prices of material, etc.

For this purpose the departments considered are four in number, namely, maintenance, equipment, power and transportation. These estimates are gone over by the general manager in conference with the department heads before the various amounts are allowed. When this has been done, each department head is furnished with a copy of this tentative six-month budget showing the amounts which he is authorized to spend during that period under the various accounts, divided in accordance with the Interstate Commerce Commission method of accounting, with the understanding that he may schedule his work with the view of spending these amounts provided the gross earnings do not fall materially below the estimates. This is given the title of "controlling sheet" and the one for the six months July to December, 1922, is shown in one of the illustrations.

This six-month controlling sheet is followed by individual monthly controlling sheets issued during the last week of the preceding month. Practically the same system is followed in the preparation of this individual monthly controlling sheet except that the estimated expenditures are not the subject of conference between the general manager and department heads, and after this individual controlling sheet has been issued department heads are not required to restrict their expenditures to amounts less than those allowed even though it may be apparent some time during the month that the earnings will fall below the estimate. This arrangement is for the purpose of giving the department heads as free a hand as possible to carry out their work as scheduled and in the most economical manner.

As each month passes, figures are filled in a column provided on this controlling sheet showing the actual expenditures so that when the accounts are closed for the month the sheet shows in four columns the estimated figures for the month, the allowed figures, the actual figures and the actual figures for the same month of the previous year.

In the monthly controlling sheet for July, 1922, the estimated and allowed figures happened to be the same, but this is not always the case.

There is also furnished to each department head before the fifteenth of each month a statement prepared by the general auditor giving the operating expenses by sources showing the amounts spent by each department chargeable to each account, which

TYPICAL SEMI-ANNUAL AND MONTHLY CONTROLLING SHEETS USED IN BOSTON ELEVATED RAILWAY BUDGET PRACTICE affords the departments an opportunity intelligently to analyze their expenditures.

The budget for capital expenditures is made out on a yearly basis with respect to the larger projects and is added to from month to month as the smaller matters come up. The practices of budgeting and controlling the capital expenditures are very similar to those of budgeting and controlling the operating expenditures except that the capital expenditures are not, of course, based on estimated earnings and are therefore followed only to the extent of insuring that the expenditures are kept within the appropriations.

The budget system in practically its present form has been in use since Jan. 1, 1919.

How Money Is Handled by Seattle Street Railway

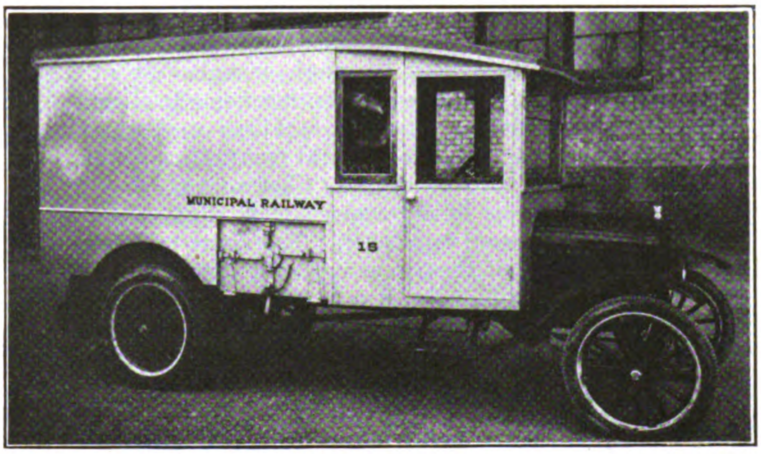
By Allen B. Hiatt

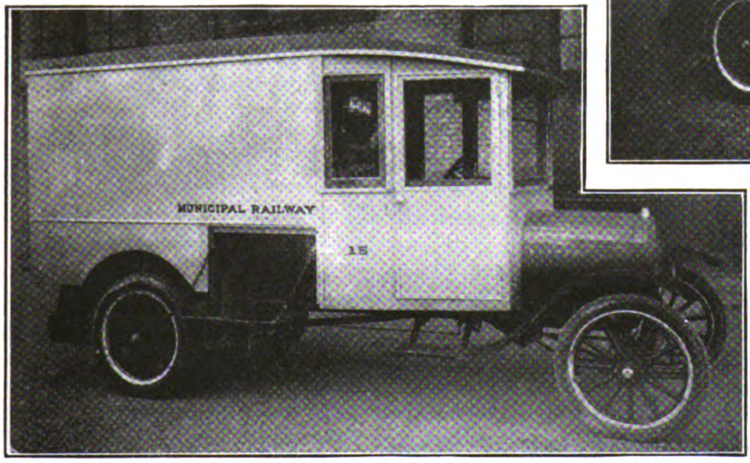
Auditor Department of Public Utilities, City of Seattle, Wash.

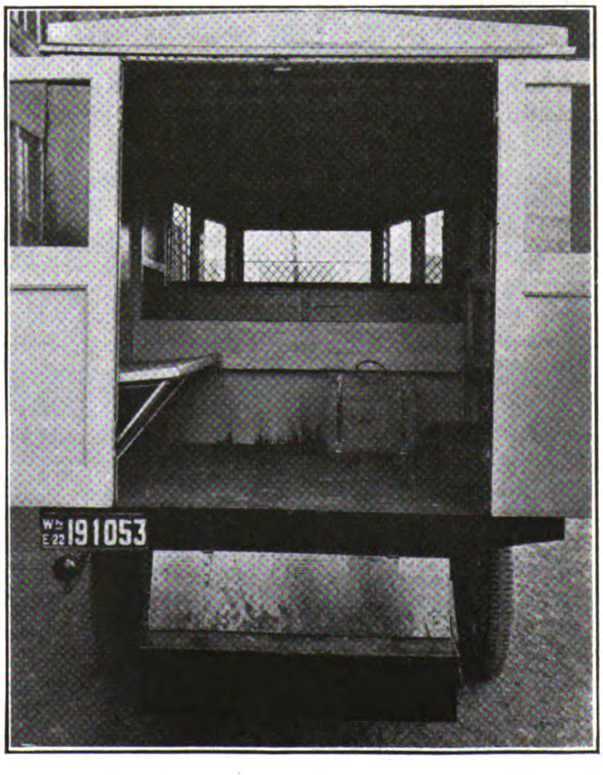
THE Municipal Street Railway of Seattle, shortly after its purchase of the Puget Sound Traction, Light & Company system, adopted the use of the auto truck for the collection of money from the carhouses and the distribution of transfers and stationery to them.

The company had followed the slower and more inconvenient method of using an old single-truck street car.

After three years' experience we recently purchased a new chassis (having worn out the old), placed upon it the old body, which we had slightly remodeled, and will continue to use the truck, well satisfied with the results.







Steel Money Compartment and Interior Arrangement, Seattle Money Car

The accompanying cuts illustrate how the body is built to fit our needs. A heavy steel tank, opening at the side of the car and placed just behind the driver's seat, extends across the body with a drop-door at each end.

In the tank, which is well secured and locked at all times, is carried all moneys. "Lost articles," stationery, transfers, etc., are carried in the body proper, a shelf being arranged on top of the tank to care for the transfer cases. Seats are placed along each side for the convenience of the cashiers on their daily trips to the banks and are arranged to fold up against the side of the body when not in use. Underneath, at the rear, is a box for spare tires, so placed as to serve for a step. The sides of the body are of sheet metal and the top of agasote. It was designed and built in our shops.

Two men, armed, drive the truck to the various carhouses, picking up the money, "lost articles," and interdepartment mail to be brought to the office, and leaving stationery and one day's supply of transfers. When the receipts have been checked, balanced and prepared for deposit they are taken to the bank by these two men and the office cashiers.

We find the truck much faster, more convenient and its routing more flexible, while at the bank we can pull up to the curb or to the alley entrance, thus eliminating the blockade of traffic on a heavily traveled street which is caused by the street car method of handling.

Wisconsin Utilities Advertise

A CHECK on the advertising carried in newspapers by the public utilities of Wisconsin during the month of January showed that 9,776 column inches were used in twenty-eight of the forty-two daily papers of the state. The four Milwaukee daily papers carried 5,505 column inches of such advertising and the weekly papers carried 1,237 column inches in addition. This aggregated about ninety-four pages of paid advertising for the month.

Safety Measures Cut Accidents

They Also Reduce Costs on the Chattanooga Street Railway Lines to 3½ per Cent of Gross Instead of More than Five Times that Amount—A Representative of the Company Gives Particulars

A REVIEW of the safety work of the Chattanooga Street Railway lines though which the percentage of accident costs to gross were reduced from 17.8 per cent to 3.5 per cent in five years is given by J. C. Costello, editor of "Electro Topics" of the Chattanooga system in *National Safety News* for December. An abstract follows:

For several years prior to 1919 the number of accidents occurring on the street railway lines in Chattanooga, and the consequent resulting expenditures, has been constantly increasing, the expense particularly being materially augmented in 1917 and 1918 as a result of a number of serious accidents. The total amount expended on account of accidents reached a maximum in 1918, when as a result of 2,793 accidents in that year and held-over claims from the previous year we expended 17.7 per cent of our passenger revenue. In one instance, the records show an expenditure for a single month equivalent to 30 per cent of the passenger revenue.

Late in 1918 the conclusion was reached that the only salvation lay in a very thorough organization of all employees for the purpose of bringing home to them the need and benefits of intensive accident prevention work. After casting about for several months for some effective method of procedure the "Chattanooga plan" of safety contests was finally evolved from suggestions received from our own employees. The contests have been the very heart of the company's safety work since their inception. Contest No. 8 is now in progress and our employees seem even more enthusiastic in the present contest that they were in the first one.

THE PLAN OUTLINED

The plan, with its many novel features, may be summarized as follows:

Members of the various operating departments, excluding superintendents and foremen, are eligible to participate. The contestants are divided into six teams, each with a captain and two lieutenants. Contests are of four months' duration; to be entitled to a prize award each member must be engaged in active company work for at least 720 hours during the four months period. The rules require that all accidents, no matter how slight, must be reported. In the cases of cars operating on the road, motormen and conductors are required to make out separate reports. Every untoward incident, such as a controller flash, disturbance or ejectment of a passenger, the frightening of an animal resulting in an accident, a trolley break, broken glass, etc., is classed as an accident. Severe penalties are meted out for failure to make out reports or for willful concealment or misrepresentation of facts in connection with an accident. The winning team divides a cash prize of approximately $600 equally among its members, and badges of merit are awarded men of other teams who have earned perfect records. Appropriate recognition is also given those who establish exceptional records in more than one contest.

The total number of accidents in 1917 and 1918 was 2,291 and 2,793 respectively, but the actual number was no doubt considerably higher, since the rules covering the classification and reporting of accidents at that time were not as strictly defined or enforced as at present. As compared with a monthly average of 233 for 1918, all classes of accidents were reduced to a monthly figure of 182 in 1919, 201 in 1920, 151 in 1921, and 123 for the first half of this year—in other words, an average of 4.1 per day now as compared with 7.8 per day in 1918.

Naturally a big improvement was noted in 1919, the first year of intensive safety work. As compared with 1918, the number of employees' accidents was decreased 44 per cent, and the number requiring medical attention 64 per cent. The total cost of employees' accidents, including lost time, payment for injuries and medical attention, decrease 84 per cent, this saving alone being twice the entire expense of carrying on all safety work, including the cost of contests.

For the same period the total number of all accidents was decreased 22 per cent. The number of claims filed decreased 56 per cent. The number of suits filed was reduced 59 per cent, and a reduction of 56 per cent was effected in the total costs on account of injuries and damages. The total accidents for 1920 was greater than in 1919. This does not mean that the results were not as good as for the previous year, but is really due to the fact that the safety plan had been better established by 1920 and more complete accident reports were being received from the men. The cost of accidents increased approximately $11,000 in 1920 over 1919 also, but this was caused by one single serious accident in January of that year which cost the company over $21,000.

The continued decrease in the number of accidents meant, of course, that more perfect records were made by employees in successive contests. This fact is readily shown from a summary of the various charges assessed against all six teams in each contest, together with the records of the winning teams. These figures are as follows:

Contest	Total Charges All Teams	Total Charges Winning Team
1	1,364	206
2	742	114
3	886	133
4	817	113
5	596	82
6	587	84
7	472	65

Just what the reduction in accidents has meant in the amount of money required to be paid out for injuries and damages is readily apparent from a glance at the following figures:

Year	Accidents	Cost	Passenger Revenue	Per Cent Accident Costs to Rev.
1917	2,291	$120,010	$672,646	17.8
1918	2,793	152,604	860,275	17.7
1919	2,182	66,356	857,372	7.7
1920	2,521	77,205	1,084,653	7.1
1921	1,817	42,050	978,202	4.3
1922—six months	741	16,152	456,272	3.5

This picture would not be complete without some mention of the cost of actually carrying on the safety work itself. Data on this subject will be found to be equally as surprising, as may be noted in the following summary which gives the total annual expenditures since 1919: 1919, $4,432; 1920, $4,757; 1921, $5,018; 1922—six months—$1,725.

These figures include the cost of preparing and printing car cards, safety bulletins, booklets, etc., the expense of publishing a monthly employees' magazine, membership dues in the National Safety Council and the expense of two delegates to the Annual Safety Congress, the costs of two entertainments and banquets staged each year at the conclusion of the safety contests and the cash prize awards to the winning teams. The $5,018 expended in 1921 was distributed as follows: $1,200 for cash prizes, $600 for entertainments, $1,100 for house organ and a like amount for safety cards, bulletins, etc., $450 to cover National Safety Council expense, $350 for payroll account, covering time of men attending safety meetings, and the balance for miscellaneous expenditures.

SAFETY MEASURES FOUND EFFECTIVE

In the early stages of our campaign to eliminate accident hazards, we soon realized that success could only be attained by the co-operation of the public as well as of employees. The first appeal was made through car cards in the form of a series of "Don'ts." These cards embodied cartoons depicting various hazardous practices of the pedestrian, motorist, careless child, and others, with advice on how to avoid accidents. The cards were changed at intervals and were subsequently superseded by a set carrying simple safety messages, unillustrated, which are still in use.

The latest innovation along this line and one that has produced much favorable comment is the carrying of a safety slogan on the dashboard of the car. About twelve trolleys are so equipped, no two carrying the same message, and it is the intention to increase the number to twenty. Various color schemes have been employed in working up the different signs and they have attracted the prompt attention of both motorist and pedestrian. One, containing the admonition to motorists not to cut-in in front of street cars, has already brought about a noticeable improvement in this practice. Other methods of impressing the public mind with the need for safety have been attempted through talks to the school teachers and the disseminating of literature among the school children.

To maintain the interest of employees, general safety meetings are held once each month and a safety committee, comprising about forty members, meets twice each month, at which time suggestions are received for improving track, overhead lines, condition of equipment, etc., and the elimination of any unsafe practices. It is interesting to note that over 900 suggestions have been favorably acted upon since the inauguration of these meetings. Bulletin boards featuring the literature of the National Safety Council are also maintained at various locations on the property to keep up interest in the movement.

Like the safety contest idea, which, after first starting among the platform men, subsequently spread to the other operating departments, every effort has been made to insure safe working conditions in every department of the company. Numerous safeguards have been provided for the various high-speed machines in the wood-working department to prevent operators from losing a finger or hand; rubber gloves and safety belts are insisted upon in the line department; every track gang carries a first aid kit in its tool box. The automobiles operated by the company are inspected at regularly scheduled times in order that any defects may be corrected; the same applies to street cars, which are inspected on a mileage basis. A monthly fire inspection is made of the entire property. Cleanliness in the various offices, shops and yards is required at all times. Every week is "Clean-Up Week" in the Chattanooga organization.

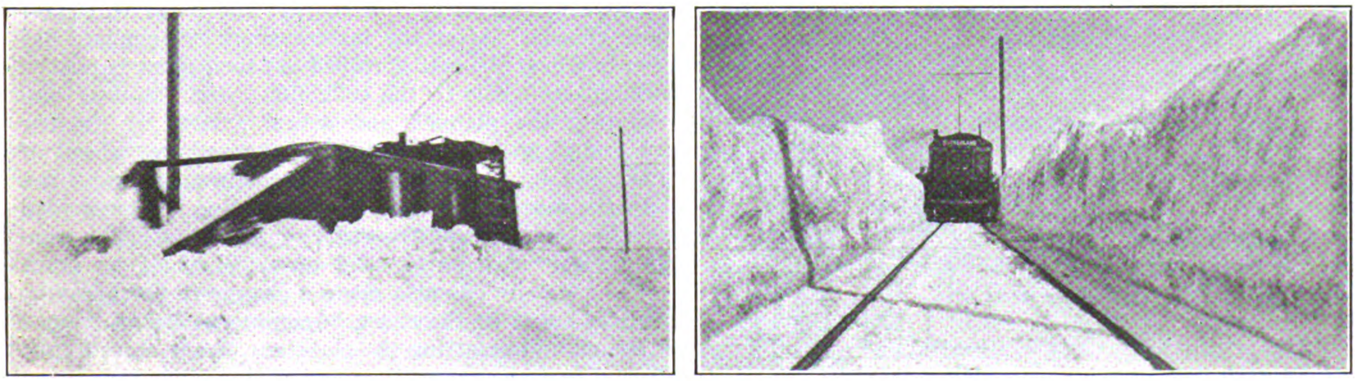
During the fall of last year, an added safety feature was the employment of a man to conduct among the workers practical demonstrations of the prone pressure method of resuscitation from electrical shock. Lessons were also given the members of the city police and fire departments and to the Boy Scouts. At least once during the past year this practice was directly responsible for saving the life of a lineman who came in contact with a 2,300-volt current.

This single instance of having saved one man's life has amply repaid the company for all the time, money and energy devoted to the teaching of safety principles and practices.

Accidents never happen, they are always caused. Carelessness on the part of some one is always responsible for the untold misery and life-long suffering that we see about us every day. Safety, on the other hand, is something which, in the abstract, costs nothing, its art is easily acquired, and it pays for itself over and over again.

Saskatoon Snow Problems

THE accompanying illustrations give an idea of some of the snow difficulties encountered along the electric lines of the Saskatoon Municipal Railway, Saskatchewan, Canada. A portion of the road serving the Canadian Pacific Railway shops at Sutherland, 5 miles from Saskatoon, is shown as it appeared last winter. The lines run across the level prairie, but owing to the continued drifting which occurs, a wall of snow was created on both sides of the track for a distance of more than a mile. The snow plow and sweeper shown at work was built in the railway company's shops. The longest period that this line was tied up last winter was a day and a half.

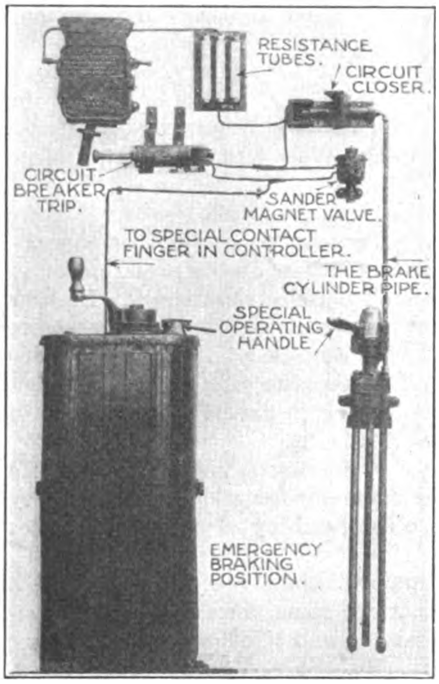


AT LEFT, BUCKING THE SNOW WITH A SNOW PLOW. AT RIGHT, HIGH SNOW WALLS ON EITHER SIDE OF THE TRACK

Safety Device with Dead-Man Air-Brake Valve Handle

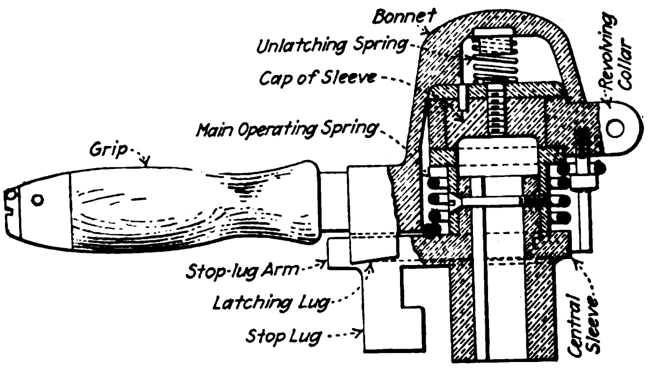
By F. L. Hinman
Assistant Superintendent of Rolling-Stock and Buildings
Philadelphia Rapid Transit Company

For three months past we have been operating in Philadelphia several cars equipped with simple apparatus designed primarily to improve the safety of operation, a feature being a "deadman" brake-valve handle. The apparatus is as shown in one of the accompanying illustrations, consisting of six pieces of equipment which, functioning together, give automatically a brake application, a release of the circuit breaker and an application of sand to the rails if the motorman releases his hold on the air-brake handle or moves it to a brake application position. The central feature of this apparatus is the special air-brake valve handle. This fits over the stem of the regular air-brake valve. It automatically goes to emergency position when released, thus providing the "deadman" feature. It is rotated to this position by a coiled spring, after being unlatched by another coiled spring in the top of the bonnet which tilts the handle upward for this purpose. In the latched position the handle operates like one of the ordinary type. After being unlatched, and thus taking the emergency position, the device may be relatched by moving the grip to the emergency position and depressing it.



Essential Equipment Used in the "Simplex Safety System"

Besides the special brake-valve handle, the equipment comprises a circuit closer, a circuit-breaker trip and a sander magnet valve. The circuit closer is a small air cylinder connected to the brake-cylinder air line and carrying on its piston push rod a quick-break head which makes connection between two phosphor-bronze springs at each brake application. The circuit-breaker trip is a cylinder containing a plunger which is normally latched against the pressure of a spiral spring. This latching lever is tripped by the pull of a magnet on the rear end of the cylinder. The sander magnet valve is simply an electrically operated valve supplying air to the sand traps.



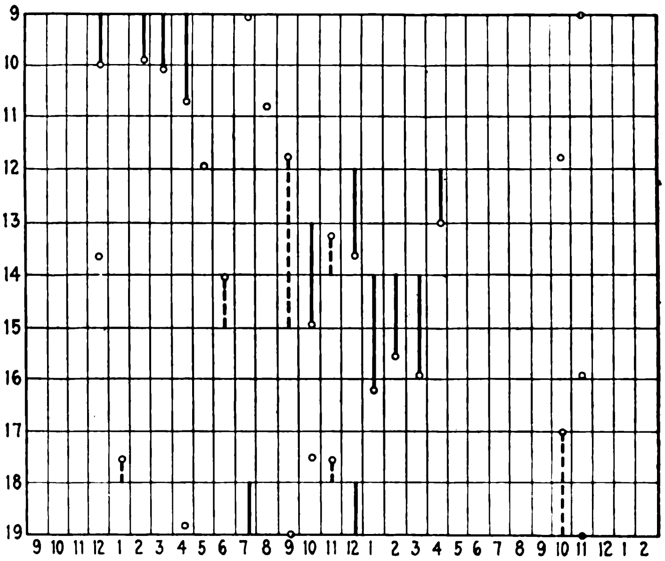
Cross-Section of the Special Brake-Valve Handle

The above aggregation we have entitled "The Simplex Safety System." Patents on the new features have been applied for and in due course provision will be made for manufacturing the essential pieces.

Rapid Checking of Headway Recorder Records

Through the use of a sheet of celluloid as a template, J. R. Ong, transportation engineer of the Georgia Railway & Power Company, saves appreciable time in securing a check of actual schedule against headways on the railway lines in Atlanta.

The company carefully checks its schedule times and running times, as described in the issue of this paper for May 6, 1922, and in this work uses a Nachod headway recorder, which is moved from route to route as necessity indicates. The report sheet taken out of the recorder is placed under a piece of celluloid on which the schedule headways are indicated by holes which have been slightly countersunk and then the countersunk portions blackened by ink so that the holes will show more clearly. After the master sheet or template has been laid over the actual record, a pencil point is pushed through each hole in the celluloid. Next the dots representing the planned and actual arrival of the car are joined up by a blue line, if the car was ahead of time, and by a red line, if the car was behind time.



Portion of Headway Record Showing Actual Time of Cars, Checked Against Schedule Time

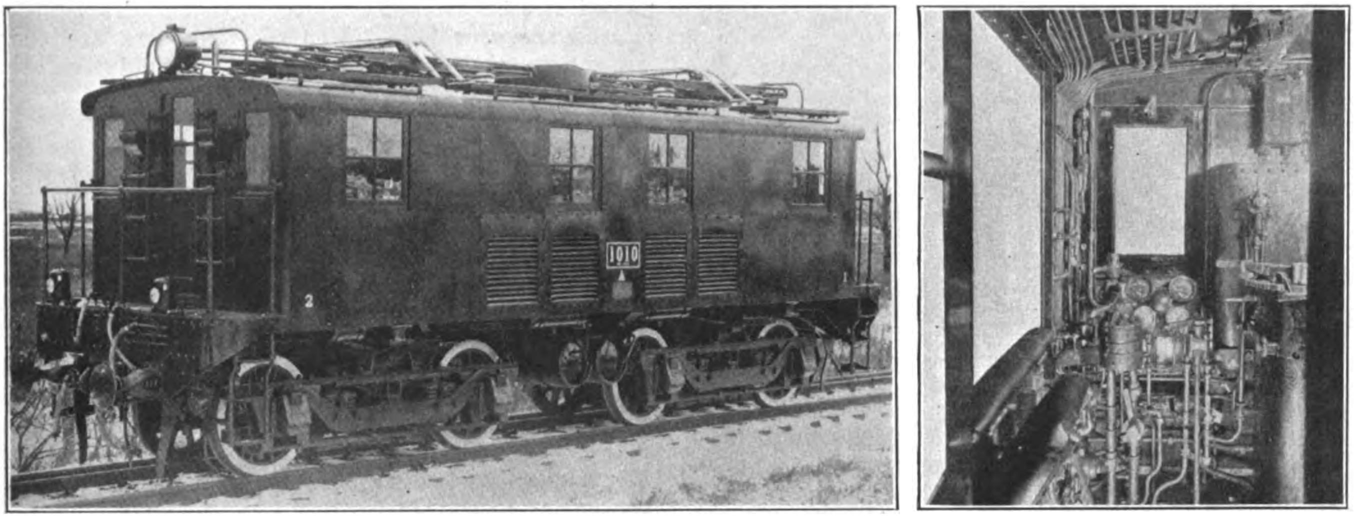
In the reproduced section the blue line is represented by a broken line, and the red by a solid line. The complete record can be checked up within half an hour.

The company has also made a change in the arrangement of hours on the sheet, beginning at 5 a.m. instead of 9 a.m. and resetting the clock movement accordingly. These hours are put on the sheet with a rubber stamp.

Electric Locomotives for Japanese Government

They Are Equipped with Motors Specially Designed for Narrow Gage, and Have High-Speed Circuit Breakers and a New Form of Electro-Pneumatic Control—They Are for 1,500-Volt, D.C. Operation

ON THEIR way to Japan are two locomotives ordered some time ago for the Imperial Government Railways of Japan from the General Electric Company and built at the G. E. Erie Works. These will be tried out on the Tokyo-Yokohama line, which was electrified in 1915 at 1,200 volts direct current. The government plans in future installations, however, to use 1,500 volts.



At Left, 1,500-Volt, 1,040-Hp. Locomotive for Trial Use of Japanese Government Railways. At Right, Interior of Operating Cab, Showing Left-Hand Drive

The locomotive is of the box-cab type, equipped with four GE-274 750/1,500-volt motors, geared for a maximum speed of 40 m.p.h. Its total weight is 132,000 lb., all on driving axles, and it is capable of exerting a tractive effort of 17,700 lb. on the one-hour rating. The continuous rating gives a tractive effort of 17,400 lb. at 22 m.p.h., with 1,500 volts on the trolley. In addition to the 1,500-volt rating the locomotive can be operated at 1,200 volts at a somewhat reduced capacity, and provision is made for operation at 600 volts direct current by the throwing of a commutating switch which connects all four motors in parallel. They are permanently in series for 1,500-volt operation. Protective devices are supplied to prevent damage due to accidental contact with the 1,500-volt trolley when the commutating switch is thrown to the 600-volt connection. The leading dimensions of the locomotive are as follows:

Length over all	37 ft. 2 in.
Length of wheelbase	26 ft. 0 in.
Rigid wheelbase	8 ft. 6 in.
Height over pantograph (locked down)	12 ft. 10 in.
Diameter of wheels	42 in.
Gage of track	42 in.

The GE-274 motors were designed especially for this locomotive and are the largest so far constructed for a 42-in. gage track. Each motor rates 260 hp. on 750 volts, and is insulated for operating two in series on 1,500 volts. The motors are arranged for ventilation by means of external blowers.

One of the most interesting features of the equipment is the new electro-pneumatic type of control known as Type PCL. Two master controllers, one in each operating cab, energize the magnet valves of the pneumatically operated contactors, which open and close the main motor circuits. These contactors are closed by air pressure and opened by a heavy spring acting against the pistons. Ten control steps are provided with four motors in series and eight steps with the motors in series-parallel.

Another important feature of this equipment is the high-speed circuit breaker, which is connected between the trolley and the main part of the locomotive equipment. Under normal operating conditions this circuit breaker is closed automatically on the first point of the master controller; it then remains closed unless tripped by an overload or short circuit or by momentary loss of the control circuit voltage. After being tripped for any reason, the breaker is again reset upon the first point of the master controller. Under normal operation, however, the high-speed circuit breaker does not open with the return of the controller to the off position. This circuit breaker has no mechanical latches or triggers, but is tripped electro-magnetically. This construction makes for durability and permanence of calibration.

To protect the locomotive motors against damage due to overload, an overload relay is provided, which is so connected that in case the motor current exceeds a certain predetermined value the relay contacts open the holding circuit of the high-speed circuit breaker, which then opens and thus relieves the overload.

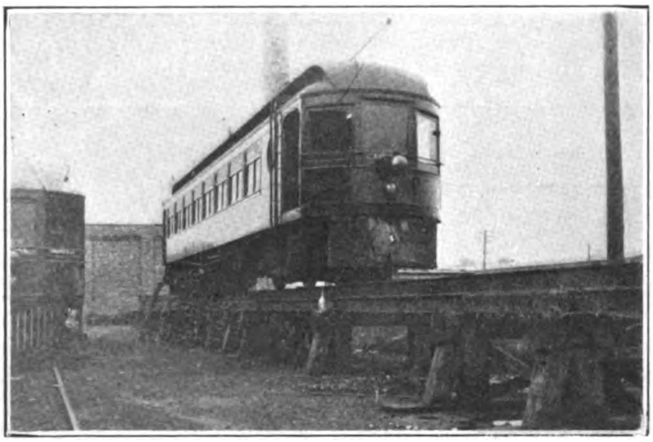
For collecting the 1,500-volt current, two slider pantograph trolleys (one a spare) are provided having a range of 7 ft. from minimum to maximum height. These pantographs are raised by admitting air to a set of cylinders and are held against the wire by springs, which are in turn held under tension by the compressed air in the cylinders. The contact elements consist of easily renewable copper wearing strips. A hand pump supplies compressed air for raising the trolleys for initial operation when there is no air pressure on the locomotive.

The control current is provided by a dynamotor arranged to supply 750 volts for the low-voltage control circuits and lights. In conjunction with this dynamotor there are two air compressors designed for 750-volt operation, but doubly insulated. The middle point of the air compressor circuit is connected to the midvoltage point of the dynamotor to insure equal division of the load between the two compressors. The two blower motors for ventilating the traction motors are also designed for 750 volts each and are doubly insulated.

In the engineer's cab the master controller is located on the left side of the cab to conform to the practice in Japan of running to the left instead of the right.

Elevated Track for Underbody Maintenance

IN MOST cases the amount of rolling stock used by electric railways has increased in a greater proportion than shop facilities. Many roads are doing inspecting in yards adjacent to the shop. Where work has to be done underneath the car body a pit is almost a necessity. A suggestion as to how tracks can be elevated to provide for outdoor work which would otherwise require a pit is shown in the accompanying illustration. This elevated track is in the yards of the Indiana, Columbus & Eastern Traction Company at Springfield, Ohio, and good use is made of it in taking care of interurban car repairs.

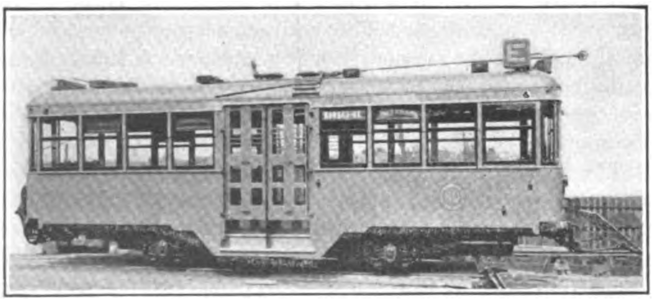


ELEVATED YARD TRACK FOR UNDERBODY CAR REPAIRS

New Cars of San Francisco Municipal Railway

THE San Francisco Municipal Railway has placed in service twenty small center-entrance cars built by the American Car Company. A sample car of this type was placed in service in the early part of 1921 and was described in the *Electric Railway Journal* for Jan. 29, 1921. The cars now placed in service are of the same type. A single-truck car with center entrance is somewhat of a novelty when compared with the general type of cars now being built. The San Francisco cars are but 29 ft. 10 in. over bumpers and have a seating capacity of thirty-two. Brill Radiax trucks are used. The underframe is constructed of steel commercial shapes and plates, and the upper framing, corner and side posts are of oak. The outside sheathing is No. 14 gage steel and the letterboard No. 10 gage steel. O. M. Edwards Company's trapdoors and steps are used. The accompanying table gives some of the principal dimensions and data.

Other parts of the equipment include Hunter illuminated destination signs, Garland B2 exhaust ventilators, Farraday push button signals, and Rico hand straps. The car has both air and hand brakes. The air brakes are furnished by the Westinghouse Traction Brake Company and the hand brakes are the National Brake Company's Peacock standard type. Type C Eclipse lifeguards are provided. The trolley catchers are Ohio Brass Company's, and Golden Glow headlights are used on these cars.



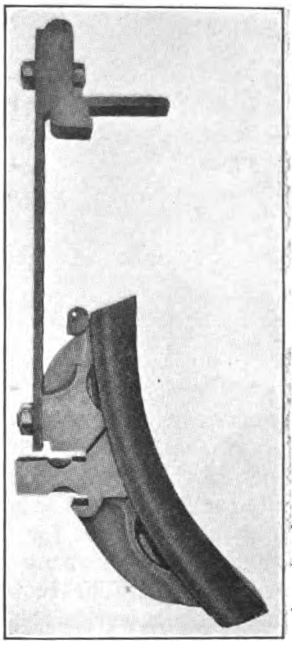
SAN FRANCISCO MUNICIPAL RAILWAY'S CENTER-ENTRANCE CAR

PRINCIPAL DIMENSIONS AND DATA OF SAN FRANCISCO MUNICIPAL CARS

Length over bumpers	29 ft. 10 in.
Maximum width over window sills	8 ft. 8¾ in.
Height from rail over trolley board	10 ft. 2 $\frac{7}{16}$ in.
Truck wheelbase	12 ft.
Seating capacity	32
Weight, complete	26,200 lb.
Type of truck	Brill "Radiax"

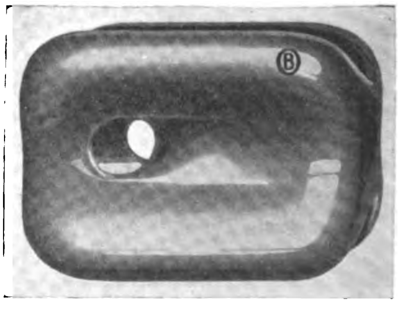
Simple Brakeshoe Hanger

THE accompanying illustration shows a new type of brakeshoe hanger which is being marketed by the National Safety Devices Company, Waterloo, Iowa. It consists of a flat spring which connects the upper casting of the brake head with the truck frame. It can be used either for inside or outside hung brakes and consists of but five parts, the upper casting, brake head, flat spring steel hanger and two short bolts. This is about one-third the number of parts required for other hangers. In addition to the fewer parts which are necessary, the manufacturers claim that a greatly reduced maintenance cost and even wear on brakeshoes will result from the use of this simplified hanger.



Small Size Insulator Brought Out

A NEW and small sized insulator has been brought out by the Ohio Brass Company, Mansfield, Ohio. It is 3½ in. long, 3¼ in. in diameter, and has a half-inch hole for stranded wire. It is made of high-tension wet-ware porcelain, and due to the X shape has a very long leakage path. This insulator is designated by the manufacturer as type XH.



SMALL SIZE INSULATOR

Letters to the Editors

Railway Publicity in Australia

NEW SOUTH WALES GOVERNMENT RAILWAYS & TRAMWAYS

SYDNEY, Sept. 19, 1922.

To the Editors:

The article in the July 1 issue of the *Electric Railway Journal*, describing the operations of the advertising section of the American Electric Railway Association, has been read with considerable interest here in the mother state of the Australian Commonwealth. Perhaps a little information of the growth of the publicity idea in Australian railway management will be of similar interest to readers of the *Electric Railway Journal.*

It will need to be emphasized first of all that the Australian railway systems are all government-owned and state-controlled. In New South Wales both the railway and tramway (street car) services are state-owned. They are administered by a board of commissioners who are vested with arbitrary powers by a special act of parliament, thus removing the control of what has grown into a huge industry from anything in the nature of political patronage. Some idea of the size of the New South Wales railway and tramway systems will be gleaned from the fact that in the financial period ended June 30, 1922, the total earnings amounted to £18,823,154 sterling (about $94,000,000). The total working expenses were £14,691,918 (nearly $71,000,000), the difference between these two amounts, £4,691,236 (nearly $23,000,000), being paid into the consolidated revenue of the state to assist in carrying the national debt.

Being state-owned, the point is continually emphasized that the railways and tramways "belong to the people." This, in its turn, has meant the creation of a large body of keen critics of railway administration. There are so many people really, especially people entirely untrained in railroad work, who think they could do the job very much better if they only had the chance. There, in a word, is the reason for the establishment of a publicity office; and there is, at the same time, a permanent and ever-varying field of operations for the publicity officer.

It may be that some time in the future the commercial side of the publicity department—the advertising section—will become associated with the new scheme. Up to date, however, the publicity office has been entirely concerned with the work of disseminating reliable and up-to-date information about the operations and administration of the services. In addition to replies to criticism and complaints which find expression in the public press of the country, the office is continually engaged in the preparation of up-to-date statistics and the compilation of valuable information with regard to every aspect of railway work and administration.

The article in the *Electric Railway Journal* declares that the "most constructive work done by the advertising section of the American Association has been that of giving electric railway news a real standing in the papers and periodicals of the country." It can be confidently asserted that the same desirable result has been achieved by the publicity office of the New South Wales Railways & Tramways Department. Practically the entire press of the country now receives with avidity the information which is sent out in a stream of daily communications from the publicity office. When this work started it was face to face with a blank wall of popular ignorance of railway affairs, and particularly of railway finance. Evidences of serious misconceptions of these things are now comparatively rare.

The importance of educating the public mind on these matters may be gaged from the fact that the chief commissioner of the New South Wales railway and tramway services controls more than 50,000 employees, which means that the railways and tramways constitute an industry embracing one-tenth of the entire wage-earning population of the state.

Attached to the publicity office of the New South Wales railways and tramways is an information bureau. The business of the staff of this bureau is to have in readiness, available for use at a moment's notice, up-to-date and reliable information and statistics in regard to railway and tramway operations, not only of our own systems, but also of the systems of other states of the commonwealth and of other countries of the world.

A similar experience to that indicated in your July issue in regard to the reliability of the articles, the statistics and general information supplied to the press, has been realized here in New South Wales. A plain intimation has been made to the entire newspaper-reading population of the state, and continually emphasized, that the state-owned railway and tramway administration has nothing to hide from the people, and is prepared at all times to supply the fullest information to those who are seriously concerned in the administration of the commissioners. This has had a most signal and beneficent effect. We invite criticism, but we say to all our critics: "Get the facts first; we will supply you with the facts if you will ask for them." The effect of this policy might be easily imagined. Without pursuing the subject further, it might be confidently asserted that the idea of a publicity office, attached to the various Australian commonwealth railway and tramway systems, will shortly become an integral part of the administration of these huge public concerns.

THOMAS CROUCH,
Publicity Officer.

Appreciates Assistance of Electrical Press

THE SOCIETY FOR ELECTRICAL DEVELOPMENT, INC.

NEW YORK, Dec. 19, 1922.

To the Editors:

At the meeting of the directors of the society, held at headquarters on Nov. 25 last, the assistant to the president, in his semi-annual report, called attention to the very excellent co-operation that the society is receiving from the electrical trade papers.

On motion, duly seconded and carried, the directors instructed me to convey to you their appreciation for the effective way in which you are bringing to the notice of the industry the work the society is doing. They further instructed me to express the hope that we may be favored with a continuance of your wholehearted co-operation and to assure you of their desire that the society work always for the best interests of the industry.

J. SMIETON, JR., Secretary.

Electric Railway Publicity

Devoted to How to Tell the Story

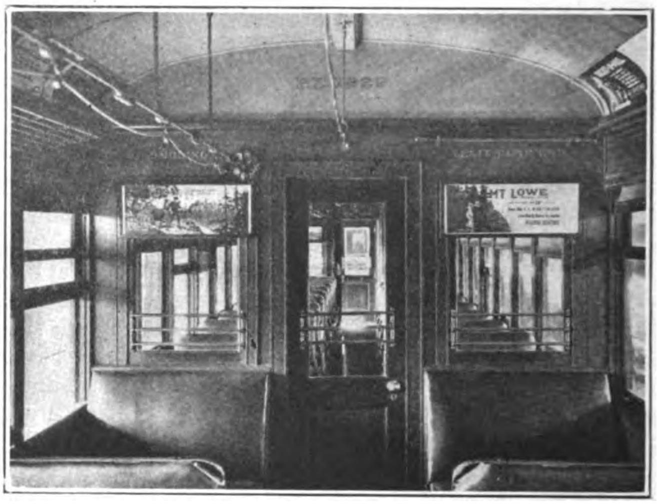
Selling Rides by Advertising

By Clifford A. Elliott
Cost Engineer Pacific Electric Railway,
Los Angeles, Calif.

THE Pacific Electric Railway's interurban lines, of more than 1,100 miles of track radiating out of Los Angeles as far as 70 miles and serving some fifty-seven cities in four counties in southern California, have innumerable points of interest for the large number of tourists who yearly visit this section of the state. It is not only the policy of the company's passenger traffic department actively to interest these tourists in the many attractive points of interest on the company's lines, but it is also the aim to attract the permanent residents of the various communities to visit such attractions. These attractions consist of resorts operated by the company or those operated by others conveniently reached by the company's lines.

In the summer season the large volume of travel tends to move to the many beach resorts located on the company's lines, while during the fall, winter and spring season the travel tends to move to the foothills, from which points of vantage travelers in large numbers move in numerous hiking parties to and from the wonderful mountains available for such purposes. In the large ranges of mountains located inland from the Pacific coast are operated many mountain resorts, which are a large attraction for vacationers during the summer season. Some of these resorts are open the year round, particularly the company owned and operated resort located 1 mile above sea level on Mount Lowe. This trip by trolley is nationally known.

In interest of attracting travel to the many advantageous points for hiking among the mountains, the passenger traffic department circulates a twelve-page attractive folder on hiking. The interior section of the folder—17 in. x 24 in.—carries a very comprehensive detail map, showing the location of all the government trails, Pacific Electric lines, resort and mountain camp sites, various canyons, mountain ranges and other valuable information for the use of hikers.



How Ride-Inducing Advertisements Are Mounted in the Cars

Attractive lithograph cards are placed in wooden frames inclosed in glass, which feature the most important points of interest on the company's lines. Two sizes of cards are used. One 10 in. x 26 in. for small types of cars; the other size being 12 in. x 28 in. for large types of interurban cars. The cards are printed oversize with margin in order that they may be cut down to fit the particular frame in the cars in which they are displayed. In displaying these cards eight frames are available in the majority of the cars. One of the illustrations shows the position of the display frames in the cars. Four of the frames are in the smoker section and four in the other section of the car. This allows two frames to each end of each section so that a prominent view of the cards is always had, whichever way seats may be reversed for the car movement. The Pacific Railway Advertising Company rents the upper or roof section of all the company's cars for interior car advertising, displaying standard 10-in. x 20-in. cards held in place by standard metal containers.

However, the company reserves for its own use the car end sections, which are fitted with a special type of frame located at the right and left sides of the car doors, and easily observed by the traveling public due to their convenient location. These cards are changed every three to six months, whenever they become dirty; also the type of the card is changed from time to time with a view of getting the subject fresh in the public's mind from another angle. In previous

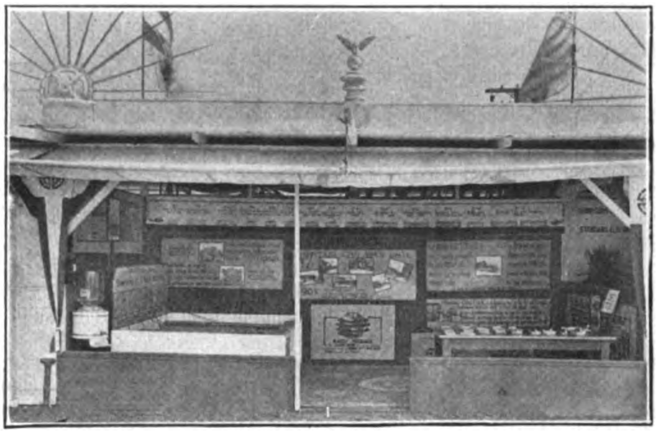
Samples of Car Cards Used by the Pacific Electric Railway years some of these display cards indicated the rate of fare for reaching the various points of interest, but of late these fares have been omitted due to occasional changes in passenger rates, elimination of war tax, etc.

The frames are made of ¾-in. molding fixed in place by two wood screws in each of the four sections that go to make up the frame. This type of frame permits its easy removal for renewing the display cards.

"The Street Car's Carpet"

THE material that goes into a street railway roadbed from earth to surface paving was illustrated as a feature of an exhibit used by the Los Angeles (Calif.) Railway in the Pageant of Progress and Industrial Exposition held in that city recently.

The roadbed construction was set in a box 8 ft. long and 6 ft. wide with a heavy glass at one end to show a cross-section. A top view showed the roadbed graduated down from surface paving to concrete sub-paving, the rail, ties, ballast, tile drain and earth. A large poster at the back of the box headed, "The Street Car's Carpet," was marked in squares, and each square was devoted to one of the articles in the track exhibit, such as rail, ties and ballast. Ribbon streamers connected the articles with the data on the poster, showing the amount of the various articles used in laying 1 mile of track. All figures were for double-track construction.



A cloth strip 20 ft. long occupied the full length of the booth with a "historical parade" of street cars used in Los Angeles from two-mule cars to two-car trains. The poster showed the years the various types served the city and the cost.

A poster that attracted considerable interest was headed "Why Your Car Was Late." This poster was made up of photographs of traffic blockades caused by broken-down trucks, street repair work and other causes beyond the control of the company. These pictures were procured by having a photographer ride on an emergency auto for a day.

Other posters advertised the safety records of the company, the number of cars in service at various times, right and wrong way to board a car, and urged passengers to avoid delay by having correct change. A trolley wheel and piece of trolley wire attached to a poster showed the size of these articles and the number of miles of wire used, and its cost.

Two men were at the booth at all times to explain details of the exhibit and to distribute literature.

Kentucky Men Discuss Public Relations

A Meeting of the Kentucky Association of Public Utilities at Lexington on Dec. 12 Was Well Attended—All Classes of Utilities Were Represented

APPROXIMATELY 180 delegates registered at the meeting in Lexington on Dec. 12 of the Kentucky Association of Public Utilities. This is the seventh annual meeting held by the body, which represents all classes of utilities, and most of the addresses and papers related to the need of establishing good public relations. The principal paper relating to traction matters was presented by James P. Barnes, president of the Louisville Railway, whose topic was "Internal Public Relations," and was based on the idea that the inside working of an organization must be right before it can develop its outside relations correctly. An abstract of this paper appears elsewhere in this issue.

Sessions were held both in the Phoenix Hotel and at the University of Kentucky. In addition, there was a banquet on Monday evening at the Lafayette Hotel for those delegates who arrived on that day. The hosts were the officers of the various utility companies in Lexington.

The session on Tuesday morning opened by an address by the president, L. B. Herrington, vice-president and general manager Kentucky Utilities Company, Louisville. An abstract follows:

PRESIDENT'S ADDRESS

In his address Mr. Herrington pointed out that a year ago the utilities of the state were still suffering from the consequences of the war, but confidence in an early and complete recovery permeated last year's meeting. Scarcely was the meeting over, however, before the coal strike and the rail strike came, retarding recovery, but the way in which the utilities gave service during those trying days will be borne in mind by the public.

In spite of all that has been said and done, a considerable portion of the public has an opinion of utility companies which is not flattering. They will never be able to get all of the people on their side, but if they continue to take all of the people into their confidence, give good service, charge reasonable rates and give customers an opportunity to become partners in the enterprise, the utilities will gain the respect, confidence and good will of the large majority of people. Without this good will, capital for necessary utility extensions cannot be secured, and a community cannot grow unless its utilities are healthy and growing.

A utility gives more than it takes out of a community, and if a part of its capital is furnished locally, even the return on that part of the capital remains to build up that community. During the past year some of the utility companies in the state have conducted successful customer ownership campaigns, and this plan is recommended to those member companies which have not tried it. Further support of the work of the publicity bureau was also urged.

For the first time in the history of the association, women have a place on the program. They can contribute much toward a better understanding between the utility companies and the public. They have shown an aptitude for handling successfully several branches of the electrical business. They invest in the utility securities and are among the largest users of their service and are the molders of sentiment in their homes and in their communities. The women can be reached better through the women in the industry than in any other way.

SECRETARY'S REPORT

E. F. Kelley, secretary of the association, reported that forty-seven corporation and associate members were represented among the 178 delegates registered. A news service bulletin is issued twice a month and has a circulation of nearly a thousand copies, of which 350 go to Kentucky newspapers. The remainder go to the utility companies, public officials and others. Testimony to the interesting character of the material in this bulletin has been received. Cordial relations have been established with the press by letting it be known that the Bureau of Information is always ready to give out the facts about any utility event, whether they are favorable to the company or not. Arrangements have been made for speeches before civic organizations on utility topics on request, and many members of the association had spoken. The bureau operated last year on a budget of but $3,600, of which $2,400 had to be spent for the bulletin.

"THE PUBLIC SERVANT"

Donald McDonald, vice-president and general manager Louisville Gas & Electric Company, in the paper on "The Public Servant," said that the lawyer or judge who coined this expression to describe utility companies performed a real service, both to the companies and to the public. The relation of master and servant is older than written history, and it is interesting to note that the oldest codes of Babylon and Leviticus enjoin on the servant diligence, honesty and efficiency, but on the master justice, kindness and intelligence. Men often boast of how cheaply they bought their goods, but never of the fact that their servants are underpaid or underfed. Nevertheless men do sometimes boast that in their city the street carfare is 5 cents, although they know that the actual cost is more than that. The speaker thought that a better understanding is coming about. The rôle of public servant is an honorable one. It is desirable that the utility should take care to be a good servant, and the municipality should take care that it should be a good master.

NEWS IN ITS RELATION TO PUBLIC UTILITIES

In a talk on this subject Brainard Platt of the *Courier-Journal* and *Louisville Times* referred first to the greater willingness at present of utilities to give the newspapers information, even if not always favorable. He described news as: "That characteristic of any happening which gives to it an appeal beyond the circle of those immediately concerned," and pointed out that an item which might be news for a weekly in a town of a few thousand population would not be a news item to a daily paper in a city of the first, second or third class. The former might like to know when a new motorman was put on the interurban that passes through the town. The paper in a big town is interested only when the motorman serves for a long time without an accident and perhaps receives a medal for such service. The big activities of the utilities are also news, such as extension of facilities, development of old policies or change to new ones, floating a large loan or canceling one, defying a strike or settling a strike, organizing the employees in the union or out, increasing a wage scale or reducing one, etc. He commended the way in which the Louisville Railway gave news about its negotiations for a readjustment of fare, and how an electric road entering Louisville talked frankly of a severe accident some years ago.

He also declared that newspapers should know news confidentially only when a release date was coming. Their hands should not be tied perpetually on news given in confidence. Utilities should also be able to know the difference between news and propaganda. The former is welcomed by the papers through their reading columns. The latter should go into the advertising columns properly labeled.

Charles N. Manning, president Lexington Security Trust Company, gave an address in which he dwelt upon the importance of the utility as a community builder.

MEETING AT THE UNIVERSITY

At 11 o'clock at the conclusion of these addresses the convention delegates boarded special cars for the University of Kentucky, and after their arrival there held a meeting in the chapel, jointly with the students of the university. Dr. Frank L. McVey, president of the university, presided, and the principal speaker was Samuel Insull, president of the Commonwealth Edison Company, who told of the early efforts of Edison and technical developments down to the present day. He declared that opportunities in the electrical business for the young man of the present time are greater than fifty years ago, provided the man is willing to make the necessary sacrifices to succeed.

After an inspection of various departments of the university and a luncheon at the university cafeteria, the meeting reconvened in the afternoon in Mechanical Hall, where the first address was by F. Anderson, dean of engineering. Dean Anderson gave an interesting talk on training men for utilities, arguing that the men should be trained for executives rather than merely receiving a technical training, and A. S. Nichols, general manager Paducah Electric Company, spoke on "Looking Forward." There were other addresses, including one from Mrs. Florence A. Tate, chairman Women's Public Information Committee, East Central Division, N.E.L.A., who spoke about "Women's Interest in Public Utitilies." Mrs. Tate referred to the numerous opportunities for positions for women in the commercial department, accounting department, purchasing department, stock and bond department, information department, and public relations department of utility companies. She also pointed out how the utilities are partners in every home and have brought to the home devices to conserve women's time and strength and for the rich and poor alike.

Miss R. E. McKee, who occupies the same position with the Great Lakes Division, N.E.L.A., also spoke, as did W. S. Cramer, president American Water Works Association, Lexington. The subject of his address was "The Foundation of Public Service."

NEW OFFICERS

Officers elected at the meeting, just before the close, were as follows:

President, W. H. Harton, Covington, general manager Cincinnati, Newport & Covington Railroad.

First vice-president, J. P. Pope, general manager Kentucky Traction & Terminal Company, Lexington.

Second vice-president, James P. Barnes, president Louisville Railway.

Treasurer, P. S. Pogue, president and general manager Louisville Home Telephone Company.

Secretary, E. F. Kelley, secretary to James P. Barnes, president Louisville Railway.

Executive committee: John G. Stoll, Lexington; Donald McDonald, Louisville; A. S. Nichols, Paducah; L. B. Herrington, Louisville, and H. J. Cochran, Maysville.

Internal Public Relations*

The Public Relations of a Company Can Be Measured, Just as a Fever Chart of a Patient Illustrates His Condition

BY JAMES P. BARNES
President Louisville Railway

THE state of a public utility company's relations with the public it serves is an accurate thermometer of its health as a public service. Fever charts of the condition of a utility company could be charted therefrom as surely as the bedside fever chart of a hospital patient. Moreover, the public relations fever chart of the utility company bears much the same relation to its corporate health as would the bedside chart to that of a patient. When all is well, temperatures are normal and the fever chart becomes a relatively meaningless record, but let the pneumonia of broken promises (chill breaths that blow good to no one), or the blood poisoning of distrust (bred from that foul germ double dealing), affect the patient, and the fever chart becomes a mountain peak of threatening terror to nurses and physicians.

Now the parallel between individual and corporation can be developed to any desired extent and the similarity of the two is impressive. What we wish to consider especially now, however, is the very remarkable parallelism of the corporation and the individual in these important particulars:

1. The fever chart records symptoms, i.e. results, not causes.
2. The temperature goes up more rapidly and dangerously than it goes down.
3. The fever chart reflects an internal condition.

The clinical thermometer of medicine is a simple instrument readily applied and easily understood. Its indications are positive and strictly relative; are in terms of but one dimension, viz., degrees Fahrenheit. True, pulse and respiration are also of importance, but they are strictly relative and in the case of the individual, we deal primarily with not more than three major indications, all easy of observation and comparison.

Compare this situation with the difficulty of any honest attempt, even superficially, to gage the temperature, pulse and respiration, representing, say, the cordiality, prompt response and outspoken comment critical or commendatory of the public in respect to a public utility corporation in its service.

Observation must be made from widely varying angles. The cordiality of the banker will not be the same in kind or degree as that of the laborer, and only a fine discriminating intelligence can gage the relative importance of these two and all the other classes at any particular time. Here the element of the observer's judgment enters and becomes of prime importance and the value of his observations and determinations is all too apt to be, or become, tinged with self-interest or personal prejudice.

So the first of the symptoms—temperature, is neither easy nor certain of ascertainment.

Prompt response—the pulse of the public good-will is almost as uncertain. Mankind, generally, responds more quickly and more sharply to unpleasant than to pleasant disturbances. Complaints, therefore, are more numerous and more emphatic than commendations, and the just proportion between the two is again a matter for judgment to determine. A condition may exist in which complaints are not made because of a sense of their futility. This condition is more common than is generally or frequently supposed, and under this condition the absence or rarity of complaint certainly does not denote a healthy condition of the public pulse. Other criteria suggest themselves by whose application it is easy to demonstrate that in this respect, as in others, the public's attitude must be widely observed and carefully studied by the operator who would not commit the fatal blunder of fooling himself.

Let it be never forgotten that comment regarding the conduct of a utility is more outspoken in some places and under some conditions than at others. Seldom is it true that any one man, whatever his position in the corporation or in the community, can take the full measure of what is being said in all circles, and for this reason, if for no other, it is essential that the successful utility manager shall not only be a good listener, but that he shall also cultivate and encourage the people who tell him what they hear for and against, and particularly against, his methods of management and their results in service to the public.

Every one knows that unfavorable symptoms multiply and intensify more rapidly than favorable ones. History records many cases of individuals great in their achievements, strong in their personalities, slowly building reputation and place in the public esteem, then suddenly and completely ruined in that esteem almost in the twinkling of an eye. Public relations resemble an intricate and delicate edifice, to be reared only in painstaking care and devotion over long periods of time, but subject to sudden collapse if weakness develops in foundation or structure at any one of many important points.

The time has long passed when any public utility operator will deny or belittle the importance of correct relations with the public, and the time is fast approaching when no public utility operator will dare attempt to establish public relations on any but the basis of complete and open frankness of dealing.

CHART INDICATES INTERNAL CONDITIONS

This brings me to the third, and by far the most important consideration heretofore set out, viz., that the fever chart of public relations reflects internal conditions.

Men's relations in the day to day contacts of business are on a basis which presupposes a condition of normal healthy functioning on the part of each. Seldom does the unbalanced physical or mental individual continue for long to discharge the duties of normal relationship in business matters. True, there are cases, and very noteworthy cases too, of men who rise superior to physical limitations and mental or educational handicaps, and who command thereby and therefore the warmest admiration and devotion from their associates. These cases are the rare exceptions, however, and are in themselves abnormal.

---

*Abstract of address presented at a meeting of the Kentucky Association of Public Utilities, Lexington, Ky., Dec. 12, 1922.

The corporation must follow the lines of normal functioning, for with normal public reactions it must deal. Reactions may be widely different as between communities, but always remember that the reaction of a given community is its normal reaction, for normality is based on the average, or the majority, and as thinks the average or majority of citizens, so will the community be governed.

Grant that a community can be but normal and grant that the internal condition of the corporation serving it may be measured in terms of the normality of its particular community.

Judge the health of the public service corporation by the esteem in which it is held by its community.

Then, lest the health—that is the public relations — fail, guard first against internal cause of failure. Look to the virtue of patience, courtesy, frankness and honesty to maintain an internal understanding and sympathy so firm that neither the agitator nor the fault-finder can shake the ideals of the organization.

REPUTATION IS FOUNDED ON CHARACTER

Men who work together in sympathetic understanding learn to weigh one another's problems and to respect one another's accomplishments. The mutual respect had by such understanding forms sterile soil for the seed of the agitator and trouble maker. When men know of their own knowledge that their associates are straight, hardworking folk, each in his own sphere, there's little tinder left for the flame of soap-box oratory to kindle. Defense of those we know and trust springs readily to the lips of all of us, and no finer or more lasting monument can or need be raised to an organization than that the men of which it is composed think well of it. And as they will think, they will speak, well or ill. No man and no organization can avoid the making of a record; sins of omission are recorded along with sins of commission. Sometimes one, sometimes the other is more serious, but always the record is made, and always the record is interpreted, discussed and spread abroad. Reputation cannot be avoided. It is our business to see to it that reputation is fair and clean.

Reputation is founded on character and will in the long run conform to character. So it is our primary business to see that character is kept fair and clean. Truth is, after all, the mightiest force in the world, and so far as its making lies in our hands it is our moral, civil and corporate duty to see that the truth of our relations to associates and customers alike bears a fair and not an ugly face.

Build then internally the health of these public service corporations on a relationship of truth, of understanding, and of sympathy. Maintain the confidence of mankind within and without by deserving it. Place service before reward—place obligation before privilege—place honesty ahead of all—honesty of purpose—honesty of method—honesty of thought and deed—and then sleep well o' nights secure in the knowledge that summer's sun, winter's frost, nor equinoctial storm shall destroy your house—strong from within and founded on a rock.

Union Internationale de Tramways Meets

This Was the First Convention Since the War of This Association, Whose Permanent Headquarters Are in Brussels—Four Days Were Given to Technical Sessions

DURING the same week that the American Electric Railway Association was holding its convention in Chicago last October, the Union Internationale de Tramways, de Chemins de fer d'Interêt local et de Transports Publics Automobiles held its eighteenth convention in Brussels, Belgium. This association, before the war, held meetings every two years and included in its membership electric railway companies and manufacturers from all the principal countries in Europe. The seventeenth meeting was held in Christiania, Norway, in 1912, and what was to have been the eighteenth meeting was scheduled to occur in Budapest, Hungary, in August, 1914. All of the preliminary arrangements for that meeting had been made and a number of advance papers had been issued to members when war was declared and the German forces entered Belgium. The headquarters of the association have always been in Belgium, so that all the activities of the association had to stop. Since the war, the association has been reorganized to include member companies from the allied and neutral countries only, and headquarters have been reopened in Brussels.

The first function of the eighteenth convention occurred on the evening of Sunday, Oct. 2, 1922, when the members of the association who had already reached Brussels met at an informal reception tendered at the Taverne Royale by the local committee of arrangements. About 300 delegates and many ladies were present. In many respects the meeting was one long to be remembered, especially by those who had attended earlier conventions of the association. Acquaintances who had not been seen for ten years were greeted and old friendships were revived. A number of delegates who had regularly attended other meetings were missing, but their absence, so far as numbers are concerned, was more than made up by new members who utilized this opportunity to become acquainted with each other and with the older delegates. Among those in attendance were a number of official representatives to the convention from foreign governments.

MEETING ON OCT. 3

The first official session of the association was held on Monday, Oct. 3, at the Palace of the Academies on the Rue Ducale. The chairman of the meeting was the Belgian Minister of Railways, Mr. Neujean. In his opening address he referred to the important place which the tramways occupied in the social and business life of large cities, which could not long survive an interruption of their services. Their suburban and interurban extensions supply a necessary connection between the city and country communities. In looking toward the future of city and suburban transportation the minister said that he believed the auto bus would be used for this service more extensively than at present. He then referred to the extent to which Belgian capital was invested in tramway enterprises abroad, as in Egypt, South America, Canada, etc. He extended the welcome of the government to the association and said he would follow its deliberations with great interest.

Constantin de Burlet, the honorary director general of the Société Nationale des Chemins de fer Vicinaux of Belgium and president of the association, then gave an address, the keynote of which was the need for courage in the circumstances.

Mr. de Burlet first referred to the various distinguished government officials commissioned to attend the convention, including M. Max, Burgomaster of Brussels, whose name became known throughout the world during the war. He then referred to the conditions which had interrupted the work of the association from 1914 to 1918, to the present peace which, while here, left many wounds unhealed, and to the services rendered to Europe during the war by Mr. Hoover. But progress, he said, must be forward in spite of the many difficulties which seem to block the road.

Reviewing the history of the association, he pointed out that it had been organized in Brussels in 1885, largely through the initiative of Gustave Michelet, general manager of the Brussels Tramways, who was elected the first president and continued in that office until his death in 1897. He was succeeded by Baron Janssen, president of the Brussels Tramways, who occupied the office for fourteen years, when he was elected honorary president. It was at the earnest wish of Baron Janssen that the present president accepted the office.

After referring to the dependence of the industry on engineering inventions, Mr. de Burlet then spoke of the essential difference between improvements in the electric railway industry and in manufacturing, because of the lack of rivalry between different electric railway systems. An improvement which means a reduction in cost of the article produced in an industrial enterprise is hidden jealously because of the advantage which it gives a company over its competitors. With local transportation companies, however, there is no feeling of this kind. Nothing is concealed, because there is no sales rivalry. Every improvement, every step toward progress, every new invention is made public, and no better place could be found, Mr. de Burlet said, for doing this than at meetings of the International Tramway Association. The advantages of this condition are great, though not always realized. Mr. de Burlet also spoke about the expansion of the association since the last meeting by the inclusion of the bus industry.

The speaker then sketched the history of motive power tried on street railways from the time of the presentation of a paper on electric traction at the 1886 meeting, pointing out that the present trolley system was largely the invention of a Belgian, then living in the United States, Mr. Van Depoele. Mr. de Burlet then referred briefly to the damage suffered by the tramway systems in Belgium during the war, due to track being torn up and cars and other equipment destroyed or removed. The total was estimated at pre-war exchange for the Société Nationale des Chemins de fer Vicinaux at Fr. 300,000,000 ($60,000,000) and for the principal tramway companies in Belgium Fr. 25,000,000 ($5,000,000). While this material loss was great, a greater loss was suffered through the death of officials and employees in engagements against the invader. It was a satisfaction, however, to see so many old faces back and to realize that in the present membership twenty-seven nations are represented.

After referring to several of the topics before the association, President de Burlet announced as the first paper on the program that by Mr. Mariage, general manager Paris Tramway System, on the "European Electric Railway Financial Conditions." An abstract of the paper appears on page 754 of the issue of this paper for Nov. 4. Owing to the absence of Mr. Mariage, his paper was read by Mr. Bacqueyrisse, one of his associates. This was followed by a paper by Mr. d'Hoop on "Welding in Tracks and Shops," which was abstracted in the issue of Nov. 4, page 753. The discussion was brief.

In the afternoon an excursion was made to the Colonial Museum at Tervueren, and this was followed by an evening theater party.

MEETING ON OCT. 4

The session on Tuesday, Oct. 4, was presided over by Mr. Norregaard, manager of the Copenhagen Tramways. The first paper of the session was on "Motor Service Organization in Great Cities," by H. E. Blain, managing director London Underground Railways and London General Omnibus Company group. In the absence of Mr. Blain the paper was read by James Dalrymple, general manager Glasgow Corporation Tramway. It appears in abstract in the issue of Nov. 4, page 750. At the conclusion of the paper, Mr. de Burlet extended thanks to Mr. Dalrymple for the clearness of the presentation of the paper and to Mr. Blain for the contribution.

Mr. Castaing, delegate from the city of Paris, added some interesting information in regard to the operation of the Parisian bus system. He said that at present there are 1,050 buses in Paris, but next year it is expected that there will be 1,400 buses, serving a total of sixty lines. These buses cover about 120 km. (75 miles) per day and use benzol as a fuel. Tests are being made with a new fuel consisting of 50 per cent benzol and 50 per cent alcohol. It is hoped before long that all the cars will be operated with this mixture.

Mr. Dalrymple said that in Glasgow with 1,250,000 population there was not a single omnibus.

The next paper on the program was by C. J. Spencer, general manager London group of tramway companies, on "Modern Improvements in Tramway Rolling Stock." An abstract was published on page 641 of the issue of Oct. 14. In Mr. Spencer's absence the paper was read by Mr. Beckett, chairman of the Municipal Tramways Association of London, who explained that Mr. Spencer and Mr. Blain had been detained from attending the meeting because of labor troubles.

In the following discussion Mr. Bacqueyrisse spoke about some work done by the Paris Tramways in building some new cars with center entrance. If progress in Europe in car design is not so rapid as in America, he said, it may be attributed to the fact that the European engineer is more conservative than the American engineer and has less money to spend on experiments. He indorsed the suggestion in Mr. Spencer's paper that rolling stock waste could be reduced to advantage and referred to some work along these lines in which his company was engaged. (See issue of *Electric Railway Journal* for Dec. 2, page 878.) He hoped to secure with this car an economy of energy of 9,375,000 kw.-hr. annually, equivalent to 15,000 metric tons of coal at a cost of about Fr. 2,800,000. Mr. Bacqueyrisse said that the weight of the motors on this car would not be more than 15 kg. per horsepower in place of 32 kg. formerly. He also referred to the novel method of braking, in which the brakes are applied to the shaft of the motor and are quick acting. The distance required to make a stop from full speed is reduced from 45 m. to 20 m. Mr. Peridier, technical expert of the same company, gave further particulars.

This concluded the morning session. The afternoon was spent in a trip to Charleroi to inspect the new shops of the A.C.E.C., large parts of which are new because the Germans removed the former equipment during their occupation. The wire works attracted special attention. In the evening the management of the Brussels Tramways tendered the delegates a reception at the Hotel Astoria.

MEETING ON OCT. 5

The chairman at this session was Mr. Pavie, of the Compagnie Générale Française de Tramways of Paris, and the first paper read was that by Mr. Sekutowicz of the Omnium Lyonnais on "Automatic Substations." An abstract appears in the issue of Nov. 4, page 753. This was followed by an address by Mr. Rochat, manager of the Geneva Tramways, who gave statistics on the increase in wages and cost of materials used in railway operation in Switzerland in 1913 as compared with 1920. Then followed a paper by Mr. Nieuwenhuis, manager Arnhem Tramways, on "One-Man Cars" (see issue of Dec. 2, page 881). It developed following this report that one-man cars had been tried by member companies only in London, Amsterdam and Arnhem. Mr. Thonet mentioned some experiments made with one-man buses in the small town of Huy, which had given complete satisfaction.

The chairman of the afternoon session was Mr. Rochat of Geneva, and the first paper read was that on "Mercury Arc Rectifiers" (see issue of Nov. 4, page 752). The chairman complimented Mr. Odermatt on this paper and the Brown-Boveri Company on their construction.

Mr. Peridier, Paris, said he had tested some of these rectifiers and the results had been satisfactory. The apparatus possessed one peculiar quality. This is its faculty of withstanding extreme overloads. While a rotary had to be figured for an overload of a maximum 200 per cent, the rectifiers could stand momentary overloads of 300 per cent without difficulty. This is a great advantage for small systems.

The next paper on the program was that by Mr. DeCroes, Société Nationale des Chemins de fer Vicinaux, Belgium, on "Gas Motor Cars for Interurban Railways." This is abstracted in the issue of Nov. 4, page 751.

Mr. Level pointed out that some companies wanted a light and others a heavy car. Either could be built. Cars could be produced as light as 2 to 2½ tons, but there was more danger of their derailment. Mr. Varcollier explained that his system used the gas car as an auxiliary during times of very heavy traffic. Mr. Castaing spoke of the advantages of the car for routes of very light traffic, but declared that it ought to be double ended to avoid the expense of turntables, loops or wyes. His system uses cars weighing 8 tons, seating forty people, and with a maximum speed of 40 km. (25 miles) per hour.

The final report of the day was by Mr. Pirard on "Different Systems of Electric Traction for Interurban Service." It is also published in abstract in the issue of Nov. 4, page 750.

In the discussion Mr. Latigue advocated 600 volts for city tramways and 1,000 volts in the open country. Motors wound for the latter voltage could then easily be speeded up on interurban cars when the distances between stops were longer, while the tramway cars could use the cheaper motors wound for the lower potential. Mr. Peridier was of the same opinion. After further discussion the convention adjourned the last of its technical sessions.

THE BANQUET AND BUSINESS SESSION

Oct. 5 closed with an official banquet at the City Hall, attended by prominent municipal and national officials. The twenty-seven delegates from foreign countries occupied the place of honor, and more than 400 delegates and guests were present.

The business session of the association was held on Friday, Oct. 6. The most important subject considered was the place of the next meeting, to be held in 1924. Invitations were received from Glasgow, Barcelona and Warsaw, but no definite decision was made. A list of the officers elected was published on page 883 of the issue of Dec. 2. In the afternoon the delegates visited the shops of the Société d'Electricité et de Mechanique, builders in Belgium of G. E. motors, and the following day took a trip to Yprès and visited many of the famous battlegrounds.

Southwestern Electrical & Gas Association

THE Southwestern Electrical & Gas Association will hold its 1923 convention in Fort Worth, Tex., May 15, 16 and 17.

The convention committee consists of G. H. Clifford, chairman; C. E. Calder, C. P. Dodson, A. J. Duncan, H. C. Morris, R. J. Irvine, J. H. Gill, Alves Dixon, P. E. Nicholls and E. N. Willis, secretary.

Plans to federate the Southwestern Association with the South Central Association were reported and given indorsement.

A National Standard of Conductivity for Aluminum

CHARLES R. HARTE, construction engineer the Connecticut Company, New Haven, Conn., has been appointed chairman of a sectional committee of the American Engineering Standards Committee in the matter of standardizing aluminum for electrical conducting purposes. The American Institute of Electrical Engineers has been designated as sponsor for this work. Mr. Harte represents the American Electric Railway Association on the committee. Interests other than those mentioned which are represented are the American Railway Engineering Association, the American Society for Testing Materials, the United States Bureau of Standards, the Electrical Power Club and the National Electric Light Association. The organization of this committee was completed at a meeting held on Dec. 20.

The organization meeting was held in New York City, with the following in attendance: Chairman Harte, J. D. Edwards, chief physical chemist Aluminum Company of America; F. D. Hall, electrical engineer Boston & Maine Railroad; William Nesbit, representing Dean Harvey, Westinghouse Electric & Manufacturing Company; Prof. F. A. Laws, Massachusetts Institute of Technology; Dr. Frank Wenner, United States Bureau of Standards; Dr. P. G. Agnew, American Engineering Standards Committee.

Two sub-committees were appointed as follows: On research, Dr. Wenner, chairman; J. M. Darke, General Electric Company, and Messrs. Edwards, Harvey and Laws. On policy, Mr. Harvey, chairman; William Hoopes, Aluminum Company, and Mr. Harte. The research committee will collect data on the properties of aluminum, and make original investigations. The policy committee will lay out a program and prepare arguments regarding the different possible bases of standardization.

Engineering Section of A.A.A.S.

IN CONNECTION with the annual meeting of the American Association for the Advancement of Science, to be held at the Massachusetts Institute of Technology, Boston, Dec. 26-30, the Engineering Section will hold a session on Friday afternoon, Dec. 29. F. M. Feiker, vice-president McGraw-Hill Company, Inc., is chairman of this section. There will also be joint sessions with the Social and Economic Sciences Section, Friday morning and evening. Among the speakers at these sessions will be President Ira N. Hollis, Worcester Polytechnic Institute; Prof. C. F. Scott, Yale University; W. S. Murray, consulting engineer, New York City; Harrington Emerson, New York City; Calvin W. Rice, and others representing national societies and other organizations.

Association Establishes Accounting Service Bureau

THE Wisconsin Utilities Association, through its executive secretary, John N. Cady, Madison, Wis., announces the establishment of an accounting bureau in connection with the secretary's office. This has been done especially to give the smaller member companies the benefit of expert accounting service. The director of the bureau is Prof. Karl F. McMurry, who is a certified public accountant and has had extensive experience in various lines of accounting work. As far as possible, the association plans to give service to member companies without extra charge, when the work can be done at the Madison office. In cases where extensive services are required, especially work involving trips to the utility's office, this unusual service will be charged for at cost.

American Association News

Special Committee on Wood Preservation

A MEETING of the special committee of the Engineering Association appointed to carry on the work formerly done along wood preservation lines under the auspices of the committee on way matters met in New York City on Dec. 19. A. P. Way, American Railways, Philadelphia, was appointed vice-chairman. The following sub-committee appointments were announced:

1. *Specifications for open-tank treatment of poles.*—E. F. Hartmann, chairman; A. P. Way, E. L. Morier.
2. *Specifications for brush treatment of poles.*—A. P. Way, chairman; E. F. Hartmann, C. A. Smith.
3. *Specifications for pressure treatment of poles.*—C. A. Smith, chairman; M. J. Curtin, W. H. Fulweiler.
4. *Specifications for treatment of crossarms.*—M. J. Curtin, chairman; W. H. Fulweiler, E. L. Morier.
5. *Perforation process for timber treatment.* — E. L. Morier, chairman; M. J. Curtin, C. A. Smith.
6. *Review of existing specifications of the association.*—W. H. Fulweiler, chairman; A. P. Way, E. F. Hartmann.

The meeting was occupied with general discussion of the principles involved in the year's work, and suggestions were made to the sub-committees as to the lines of work which each might profitably take up. Full advantage was taken of the fact that the membership of the committees comprises experts in each of the subjects covered by the committee's assignments. The upshot of the discussion was that the specifications which are prepared shall be drawn with full consideration of the practical conditions which pertain in the preservative manufacturing field and on the commercial side of the pole business. The importance of securing co-operation with other pole-using industries was also emphasized, in view of the fact that practice in preservation and pole production is affected, in fact controlled, by the demands of the large purchasers of poles and cross-arms. The work of the American Engineering Standards Committee in this connection was seen to be promising.

Among the practical questions discussed by the committee, that of pole rehabilitation was given careful attention. The practicability of brush-treating partly rotted poles will be especially considered by sub-committee No. 2.

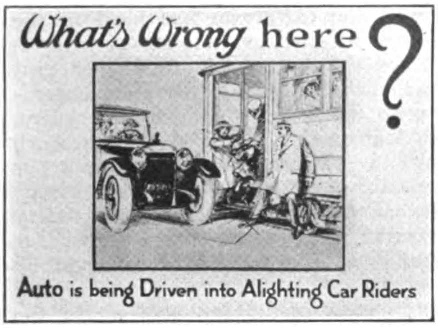
In closing the meeting Chairman H. H. George read a letter from the A.E.S.C., stating that a creosote-oil specification had been submitted to it by the Federal Specifications Board, S. W. Stratton, chairman, and that a committee is now considering the preparation of a specification which will bring the federal government's specification into line with the best practice. The American Electric Railway Engineering Association is asked to co-operate in this work.

The committee agreed, tentatively, to meet next in Washington, on Feb. 15.

Publication of Series of Accident Prevention Signs Begun

THE committee on co-operation of manufacturers, through the Advertising Section, American Electric Railway Association, has just prepared the first two of a series of accident prevention signs as illustrated. Similar signs, dealing for the present chiefly with collisions between automobiles and electric cars, will be sent out from time to time. These will be supplied in reasonable quantities to member companies without charge, and it is hoped that they will be displayed where automobile drivers will be most likely to see them. It is suggested that manufacturing and operating member companies co-operate in the placing of the signs in automobile clubs, public garages, etc.

J. W. Welsh, executive secretary of the association, is requesting that he be informed immediately by telegraph or letter how many copies of these signs will be needed.



What's Wrong here ?
Auto is being Driven into Alighting Car Riders

What's Wrong here ?
Auto Driver Trailing Car too Closely

THESE POSTERS ARE THE FIRST IN A SERIES DESIGNED TO FURTHER THE CAUSE OF ACCIDENT MITIGATION, PARTICULARLY THE REDUCTION IN NUMBERS AND SEVERITY OF COLLISIONS BETWEEN AUTOMOBILES AND TROLLEY CARS

One-Man Car Operation

A MEETING of the committee on one-man car operation of the Transportation & Traffic Association was held at the New York headquarters on Dec. 18. Those in attendance were J. P. Pope, Lexington, Ky., chairman; J. E. Duffy, Syracuse, N. Y.; A. L. Reynolds, Youngstown, Ohio, and Karl A. Simmon, East Pittsburgh. The subject especially assigned to the committee this year is one-man operation in suburban and interurban service. A questionnaire was considered, and it was decided to send out a short one asking for information which would be supplementary to a recent questionnaire on one-man cars which was sent out by the Information Bureau.

The committee will probably make a study of the safety features of this type of car and list the advantages and disadvantages.

Revision of Safety Code

AT THE recent meeting of the Engineering Association committee on power distribution, Sponsor C. R. Harte reported regarding the activities of the American Engineering Standards Committee in the revision of Part II of the National Electrical Safety Code and the preparation of standard specifications for wire crossings. He stated that, following out the suggestions of the Engineering Association on this subject, Dr. M. G. Lloyd, of the United States Bureau of Standards, in due course, named a committee which determined the representation of each of nine interests involved, to secure a balanced general committee. On Nov. 2, as reported in the issue of this paper for Dec. 2, page 883, this committee met at Washington, and elected Dr. Lloyd chairman, C. B. Hayden vice-chairman, and Roy M. Dwyer secretary. An executive committee was also appointed.

Following the adjournment of the general committee the executive committee met but took no definite action and adjourned to Nov. 27.

At that date, it was decided that the fundamental question at any crossing was the degree of hazard; that with this determined the rest of the problem was comparatively simple; but that until such determination was made little else could be done except to collect data as to permissible construction details. Accordingly there were appointed four committees, each interest being given appropriate representation.

The four committees are as follows: (1) *Grades of Hazards*—Thomas Sproule, R. A. Bloomsburg, C. R. Harte, A. E. Knowlton, M. G. Lloyd, S. M. Viele, K. L. Wilkinson. (2) *Allowable Clearances*—M. C. Wagner, M. G. Lloyd, J. H. Mathews, R. A. Smith. (3) *Allowable Ultimate Strength*—R. D. Coombs, J. A. Capps, R. C. Dwyer, W. L. Morse, W. C. Wagner. (4) *Underground Construction*—M. B. Rosevear, Arthur Halstead, W. H. Homer, A. L. Pierce, G. C. Post, F. K. Shinnen, W. C. Whiston. Others are to be added by the interests desiring representation.

The executive committee constituted itself a committee on correlation.

At the time Dr. Lloyd was forming the sectional committee, the Engineering Association appointed representatives to serve on each of the three committees which it was expected would be organized to deal respectively with power lines over railroads, power lines over signal lines, and signal lines over railroads.

The procedure now being followed in no way affects this plan; the present work is necessarily preliminary to the preparations of any working specifications and the latter will not be touched until the foundation is well established.

Educational Program Inaugurated

A LARGE attendance of the new American Association committee on education, at a meeting held in New York City on Dec. 8, attested the interest of electric railway managers in the training of their employees. No specific assignments had been made to the committee by the executive committee, so that the first task was to review the whole field of possible activity and select for this year's work the most promising part.

It was concluded that the first task is to secure co-operation of electric railway managers in putting educational plans actually to work on the several properties. The report of last year's committee outlined the possible educational activities clearly, so that the first thing now is to urge the putting into practice the suggestions of that committee.

Each company will be asked to appoint a responsible person to "head up" the local educational activities. Through these men the committee hopes to be of assistance to the companies in furnishing suggestions for actual procedure. It is expected also that the attention of managers will be drawn to the importance of this work through conventions of the sectional electric railway associations.

Efforts will also be made this year to utilize the experience of educational committees of other organizations.

The committee's plans assumed tangible form during the meeting, but will not be announced in detail until the local educational men are appointed, which should be soon.

The New York meeting was attended by Edward Dana, general manager Boston Elevated Railway, chairman; Dr. Thomas Conway, Jr., Aurora, Ill.; C. B. Fairchild, Philadelphia, Pa.; M. B. Lambert, East Pittsburgh, Pa.; C. E. Morgan, Brooklyn, N. Y.; H. H. Norris, New York, N. Y.; William von Phul, New York, N. Y., and Thomas S. Wheelwright, Richmond, Va., members of the committee, as well as the following guests: C. S. Coler, manager educational department Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.; Dr. H. E. Bricker, medical department Philadelphia Rapid Transit Company; W. A. O'Leary, director of vocational education State of New Jersey, Trenton, N. J., and Prof. W. H. Timbie, Massachusetts Institute of Technology.

PERSONAL MENTION

Franchise Valid

Higher Court Rules in Favor of Des Moines Railway—Extensions and Improvements Expected

The Des Moines City Railway and the city of Des Moines won a sweeping victory on Dec. 15 when the Iowa Supreme Court held the Des Moines franchise valid.

The case went to the Supreme Court upon appeal by the city of Des Moines and the Des Moines City Railway from the decision of Judge James C. Hume of the Polk County District Court, who held that the franchise election held in November, 1921, which granted the city railway a sliding scale service-at-cost-franchise, was illegal. Suit against the franchise was brought by the North Des Moines Improvement League with Grant Van Horn as the principal.

OVERWHELMING RAILWAY VICTORY

Not only was the high court's ruling an overwhelming victory but it has the further strength of having been concurred in by all six justices of the Supreme Court. The decision was written by Truman S. Stevens, chief justice.

The Supreme Court held that the franchise was not a perpetual nor exclusive grant but that the publication clause, which was one of the points particularly aimed at by Van Horn, was entirely adequate. Justice Stevens held that the title was not defective on account of carrying more than one subject.

According to the ruling Van Horn held no vested rights in the former franchise which was abrogated by the one accepted by the voters in November, 1921. Justice Stevens held that a vested interest is not a mere privilege but an actual property right.

PUBLIC APPROVES OF FRANCHISE VALIDITY

The decision has been received with much approval on the part of citizens of Des Moines generally, for ever since the Des Moines City Railway was granted the higher fare by the new franchise the city has enjoyed a constantly improving service and there has been a great deal of improvement on the physical property. H. W. Byers, former corporation counsel for the city, who fought the city railway at every point during his ten years in office, and who was the principal attorney for Van Horn and the North Des Moines Improvement League, when interviewed, said the "opinion seemed to be a sweeping victory for the company."

Daily newspapers have accepted the decision as a further sign for improvement in conditions here, and even the daily which has taken an unfavorable stand all through the franchise proceedings commented editorially in a favorable vein.

F. C. Chambers, general manager of the Des Moines City Railway, is quoted in the daily papers as seeing decided improvement in service and plant with possible new extensions as a result of the high court's decision. Mr. Chambers calls attention to the fact that the company will now be able to market its securities more successfully in order to permit of the expenditures for improvements and extensions.

Mayor Garver has stated that with the legality of the franchise settled the city will now be in a position to ask the company to make the extensions which are necessary to catch up with the growth of the city.

The franchise moves have been noted previously in the ELECTRIC RAILWAY JOURNAL.

Plans for Rehabilitation Fail

The interurban line which until last March was operated between Cincinnati and New Richmond, Ohio, under the name of the Interurban Railway & Terminal Company, will not be rehabilitated and restored to service. This announcement was made by William E. Harton, president of the Cincinnati & New Richmond Railway, originally organized to take over this operation. Mr. Harton is general manager of the Cincinnati, Newport & Covington Traction Company.

Failure of shippers along the route to support the project is given as the chief reason for the collapse of the plan. Persons living along this line also will be deprived of electricity, as the new company expected to supply the vicinity bordering its line with power.

The work of dismantling the old Interurban Railway & Terminal Company line already has been started. The tracks will be torn up and all equipment and stock sold or junked. This work is under the direction of Charles Leslie, receiver for the company, with offices in the Second National Bank Building.

Those interested in the proposed successor company said that residents of New Richmond had enlisted in the project. Arrangements had already been completed whereby the new company was to take over the municipal electrical generating plant of that village. The shippers who refused to promise their business to the new line believed they could ship by trucks and river at a lower cost than offered by the traction company. An arrangement whereby the New Richmond line would use the Cincinnati, Georgetown & Portsmouth Traction Company's tracks between Coney Island and Cincinnati had been worked out by officials of the new company.

$95,000 Christmas Bonus

A Christmas bonus of approximately $95,000 was paid to trainmen by the Los Angeles (Calif.) Railway Dec. 15. This is the third annual bonus paid by the company under the merit system. Bonus checks were given to 1,976 men.

The bonus is $60 a year at the rate of $5 per month. When a man's efficiency rating is 100 per cent or better for a month he is credited with $5, unless he has been absent on leave more than the prescribed number of days.

A new trainman entering the service is entitled to participate in the bonus plan after he has been in the service six months. He starts with an efficiency record card of 100 per cent and receives merits or demerits, according to the type of service he renders. A clear courtesy record for a month gives a trainman ten credits or 2 per cent increase in his efficiency rating; the same applies to a clear safety record. Other credits are given for special acts of efficiency reported by passengers or supervisors, and a man may claim credit for acts above the ordinary line of duty which he reports himself.

Demerits are recorded for acts of discourtesy and careless operation, careless reports, and other miscellaneous offenses. Demerits may be offset by credits, enabling a man to maintain his record above 100 per cent.

When a trainman's efficiency record goes below 75 per cent, he automatically dismisses himself. Only three such cases have been reported in 1922, and all but thirty of the men participating in the bonus had records of 100 per cent or better each month.

Report on Bill in Prospect

Enactment of a public utilities bill, providing for the regulation of all public utilities to be vested in a commission of the state government, will be urged by the League of Texas Municipalities. Action looking to the drafting of such a bill and its enactment into law were taken last summer at the annual meeting of the league. At that time a committee was appointed to prepare a draft of a bill.

After several meetings this committee secured the services of Dr. G. C. Butte of the University of Texas. Dr. Butte was on leave from the university to pursue special studies in utility legislation, and has been busy for three months preparing the Texas bill.

At a recent meeting of the committee in Fort Worth, Dr Butte submitted a report as to what had been done. The bill, it is said, will be ready for introduction when the Texas Legislature convenes in January.

$8,513,000 Spent in St. Louis in Three Years

Impressive Talk by Manager for United Railways' Receiver—17,782 Items of Supplies Bought, 720 from Local St. Louis Firms or Firms with Local Offices—Electrical Board of Trade Surprised by Figures

COL. A. T. PERKINS, manager for receiver United Railways, St. Louis, Mo., appeared before the Electrical Board of Trade in St. Louis a few days ago and gave a succinct account of the last three and a half years' stewardship of the property under the receiver. He told his hearers what the city must have or should do in connection with a reorganization, which is expected to take place early in 1923.

As a manufacturer of street car rides, said the Colonel, he desired to outline a few things of interest from a little different point of view—items that form the background for next year, and in which the men present were interested as citizens and manufacturers, and also as occasional users of street railway transportation.

After several years of handling the property, the speaker stated, the management found to its own great satisfaction that a majority of the traveling public is behind it. There is still some criticism due to misunderstanding, but the active opposition comes from a few persons with the mistaken idea that as in the past it is still popular to attack a thing because it is big. He deplored apathy on the part of business men, who as a whole are not making much use of trolley facilities, but use other vehicles except when the weather gets bad. Then they come to the trolley.

SURPRISE EXPRESSED AT FIGURES

Expressions of amazement were heard at some of the tables when Colonel Perkins launched into the manufacturing feature of his talk by stating the extent of supplies purchased by the receiver. He is using 17,782 different items of supplies, according to a catalog recently completed. Last year these items were purchased from 720 different firms either manufacturing or having offices in St. Louis and of these 720 there are 413 enrolled as members of the Electrical Board of Trade, 243, or about 60 per cent, represent firms from which the management has been buying electrical supplies in amount more than $600,000.

In touching further upon electrical matters, the Colonel stated that the amount of electricity for power and lighting purchased in the city of St. Louis this year was 390,000,000 kw.-hr., from the main producers, of which 215,000,000 are for lighting purposes. Of the remaining 175,000,000 the United Railways uses 47½ per cent, or almost half of the entire output for power purposes. The system uses about 30 per cent of all produced.

Colonel Perkins told what had been accomplished by the receiver and his staff in the last three and a half years by quoting some of the compliments which were paid to the management recently by Mayor Kiel at the North Broadway new station celebration. While certain persons continue attacks from political motives, the Colonel commented, they do not represent the public. Contrasting conditions in St. Louis with those in Kansas City, he quoted a statement from the City Counselor of Kansas City before the Missouri Public Service Commission. The attitude of the Kansas City official was that an injustice would be done the people of that municipality who use the street cars if his office insisted upon a reduction of fares that would seriously impair street car service. In St. Louis the City Counselor is demanding a reduction from 7 to 5 cents. A lower fare would hurt service in St. Louis.

PERSONNEL DEVELOPED

The Colonel told how the personnel has been developed under the receiver along lines somewhat different from any other he knows of. This personnel of between 6,000 and 7,000 men is for the most part trying to give the public the best service possible with the facilities at hand. During the last three and a half years about 1,500 motormen and conductors have been replaced; about 500 have been discharged, because they were not doing their work well. The manager has arranged to meet the new men every week, talks to them, soon calls them by name, and establishes relations that quickly lead to efficient and courteous service. About 95 per cent of the men are doing good work. A small percentage of the men who lose their temper must go. And those who go cannot come back, Col. Perkins stated. He then said:

> In the last three years, we have reconstructed 100 miles of track at a cost of $4,000,000. We have rebuilt 100 old cars at a cost of $1,000,000. We have built 150 new cars at a cost of about $1,500,000. Another fifty new cars under way will cost $513,000. To handle the new equipment it has been necessary to build other things—a new station and shops, seven new power substations, besides spending $1,500,000 for street paving for the use of the public. Moreover, United Railways is the largest taxpayer in Missouri, nearly 1 cent of every cash fare being paid out for taxes.
>
> We really do not get 7 cents for a car ride, the average being 6.89. Leaving out firemen and policemen and figuring in the transfers the average is 4.48 cents per ride. Although there was no increase in travel, records show that in October, 1922, on week day mornings we operated 1,153 cars as compared with 1.099 in October of last year, while in the evenings this year the average was 1,337 cars as against 1,163 in 1921.

What can be done with the traffic has become a grave problem. Rerouting has become imperative. At Eighteenth and Washington automobile traffic has become so congested it is now impossible to get all of our cars through and therefore Park and Compton cars westbound are now sent over Fourteenth Street to Pine and Eighteenth Street. Last year the receiver put in half a dozen new curves at a cost of about $4,000 each, and more are needed.

Step by step and year by year the management is working on the scheme laid down by the City Plan Commission, toward rapid transit.

The needs of the United Railways will be more serious next year, Colonel Perkins stated. In this connection he said:

> We are reaching a crisis in the valuation case before the Missouri Public Service Commission. Our brief has been filed and the city's brief probably will be filed in January. It is a big case and the commission is expected to be fair in determining the value of a great property embracing 460 miles of lines, 525 miles of track, 1,530 cars and holdings scattered all over St. Louis, St. Louis County and St Charles County. An early decision is hoped for. A total of $11,000,000 of securities fall due in 1923. and at least $4,000,000 is needed for improvements. What are we going to do to get it?

In answer to his own question, Colonel Perkins said that in order to reorganize the property new franchises are essential. The old grants present a fearful mixture of different conditions, rates of taxation, etc. And speaking of taxes, the Colonel remarked that the management has paid the mill tax faithfully. In future franchises the city should be protected and so should the people who refinance the property for public service.

In referring to the 100th birthday anniversary of the late Erastus Wells, father of the receiver and St. Louis pioneer street transportation leader, and in sketching the history of transportation with which the Colonel has been connected since 1887, a year before the first electric line was operated, Manager Perkins drew the lesson that the public and its representatives must look far ahead in developing the street car service of St. Louis. Besides making the 1923 model the best possible, it behooves the people as a whole to prepare for the future by getting behind the transportation interests and thereby bring about a service of quality and quantity that is essential to the prosperity of the city.

Legislation on Cities' Contribution to Railway Operation

Among the recommendations which the Massachusetts Department of Public Utilities will make to the Massachusetts Legislature next January is one to the effect that cities and towns shall be authorized to contribute toward the cost of street railway operation. It is provided that the Public Utilities Commissioners shall investigate the situation where one city or town petitions for authority to make such contribution, and the commission shall make such recommendations as it deems shall best further the interests of the communities affected. It is proposed that the cities and towns shall be authorized to make contributions for the purpose of securing lower fares and for avoiding a reduction or discontinuance of service.

The main recommendations to the 1923 Legislature will come later when the commission reports on a number of measures that were submitted to it by the 1922 Legislature relative to transportation service in Greater Boston. In connection with its study of that problem the commission visited New York and Philadelphia to inquire into the operation of the street railway systems in those cities.

New Ordinances Adopted

Regulations Effective in January One Provide for Identification Card System Elimination of Bus Competition and Track Abandonments—Result, Means More Municipal Control

TRACTION line operation in Davenport, Ia., was put back on a permanent basis and the legal tangle between the public utilities and the city of Davenport unsnarled recently when the City Council adopted a new set of ordinances which provides for the adoption of the identification card system of street railway fares, elimination of jitney bus competition and authorization for the company to shorten its downtown loop by abandoning trackage. The new ordinance will also result in wiping out numerous court injunctions under which the street cars operate at the present time. The general effect of the Council action is to give the company considerable relief and provide for municipal instead of court control.

EIGHT-CENT FARE WITH CARD PLAN

The present 8-cent fare is adopted by the city. It was fixed by court order over a year ago following a protracted legal battle with the former socialist city administration. The original temporary injunction of May, 1920, put a 7-cent fare into effect and this was later modified by a court order to provide for an 8-cent fare.

Entry of the identification card plan of fare is provided for in a clause which gives the city authority to put this into effect at any time following a thirty-day written notice. Under this plan the passenger pays 50 cents per month for a card and 5 cents every time he rides. It is expected that this plan will be put in operation after the holidays.

The company is required to submit a monthly report of the number of passengers carried and a detailed statement of receipts and expenditures so that in the event of the revenues showing a material increase the city will feel justified in lowering the rate.

At present, according to City Attorney Thuenen, the company is earning less than 1 per cent on its investment, a figure which he states he has secured through months of investigation.

LOSS OF $1,000,000 SINCE WAR

Joe R. Lane, attorney for the company, stated that the Tri-City Railway Company of Iowa had lost approximately $1,000,000 since the beginning of the war, for he declared that a surplus of $500,000 had been used up and that at the present time the company was the same amount on the wrong side of the ledger.

The identification card system was submitted to the socialist administration but was turned down by the socialist majority. As a number of the present Aldermen have privately declared themselves in favor of the card plan, it is expected that the plan will go into effect shortly. The ordinance also allows the sale of four tokens, each good for one car ride, for 35 cents.

Licenses for jitney buses are made from $15 to $35 a year, depending on the seating capacity of the bus. Jitney competition was also practically wiped out by a provision which declares there shall be no bus lines on streets where there is a traction line, providing, however, that where a terminus in the business district is established and must be reached by prohibited streets, buses may operate on these prohibited streets for such distances as are necessary to connect the terminals. Bus routes will be established later by the Council.

No bus may stop, take on or discharge passengers within any street intersections on streets on which street car lines are located except at the opposite corner from the one at which street cars regularly stop.

Both the city attorney and the members of the street car committee of the Council held that direct competition of the bus lines with the company was unfair, although they said that the buses had a certain value. The ordinance adopted by the Socialist City Council in August of 1920 by which jitneys were allowed to operate has been repealed. The ordinance also provides that the buses must operate on a permanent schedule and outlines the service which they must give to the public. Inasmuch as the buses now running parallel to the Third Street and Rockingham car lines do not maintain a continuous service throughout the day, operating only during the rush periods, it is believed that the new ordinance will wipe them out of business.

Jan. 1 is the date of effect of all of the utility regulation provisions.

LOOP WILL BE SHORTENED

Another bone of contention between the old Council and the utilities was removed when the Council adopted another ordinance which allowed the shortening of the downtown loop by eight city blocks. The company is ordered to remove its track and ties on Second between Scott and Warren Streets and on Warren between Second and Third Streets. It is stated that the elimination of this waste is essential to reducing the cost of operating cars. The company is to lay a new base for resurfacing of the street in the area where its tracks are removed.

The ordinances also provide that the company shall assume the cost of "devilstrip" paving that portion of the paving between the tracks where there is a double track. This agreement will assess a considerable charge against the company which the utilities sought to be freed from.

The present City Council went into office in last April, following one of the hottest battles in Davenport municipal history. The defeated party charged the successful mayoralty candidate and his aldermanic colleagues with the active support of the car company and other utilities.

This is the first move toward utility rate readjustment made since the new administration came into office, but the settlement arrived at is the result of negotiations between city officials and company representatives extending over several months.

Albany Car Jumps Track, Injures Fourteen

Fourteen persons were injured when a crowded one-man car of the United Traction Company, Albany, N. Y., split a switch and jumped the tracks on the Second Avenue line on Dec. 16 and coasted down the hill on the sidewalk, carrying away the stoops of four houses, knocking down two electric light poles and traveling an entire block before its mad career was checked.

This accident is the third of its kind that has occurred at the same point. In the summer of 1912 a car going down Second Avenue left the track in attempting to make the switch and crashed into the house at the northeast corner of Broad Street and Second Avenue, injuring several persons. As a result of this accident the switch was changed to South Pearl Street and Second Avenue, a block below. About two years after this a car left the track at South Pearl Street and Second Avenue and nosed its way into the undertaking establishment of J. M. Foll, where the trolley car finally was halted in this recent accident.

A. E. Reynolds, general manager of the United Traction Company, said that it would be possible for both air and hand brakes to function and yet have the car slide backward down the rails, if they were slippery. He added that he did not know of any safety device that could prevent such accidents, provided brakes functioned and locked the wheels.

In addition to the air brakes, Mr. Reynolds said all the cars have the hand brakes in case of emergency.

Company Opens Bank Accounts for Babies

Announcement has been made at the offices of the Monongahela Power & Railway Company, Clarksburg, W. Va., that babies born into families of the employees in the year 1923 would be presented with a $5 deposit in a handy bank. The bank book will be mailed to the happy mother as soon as it is received from the bank.

The baby fund is one of the many features that have been introduced by the company since Capt. George M. Alexander of Fairmont has been its president.

The Employees' Beneficial Association, which provides benefits for sick and injured employees at a very small cost to the men, and the annual outings of the employees held at Parkersburg and at Clarksburg are other activities that are proving popular with the employees of the company.

Tentative Regulatory Program Announced

The tentative public service legislative program of the newly elected Democratic administration in New York State calls for the creation in the city of New York, under provisions of its city charter, of a transit department to supersede the present state appointed transit commission and a public utilities department to take the place of the jurisdiction of the Public Service Commission over other utilities not regulated by the transit department, excepting telegraph lines.

To these newly created city departments will undoubtedly be transferred the employees now in the Transit Commission and the New York office of the Public Service Commission. Appointive power of the heads of the newly created departments and their compensation will be vested in the city of New York.

For other cities and municipalities, it will be made optional whether they regulate their own public service corporations or accept the regulation imposed by the State Public Service Commission, which is to be continued.

The public service commissions law itself, of course, will be amended, stripping the commission of certain powers and duties in relation to the city of New York and other municipalities where such powers and duties are exercised by local commissions or departments of municipal government and that part of the public service commissions law relating to the Transit Commission will be repealed, as its provisions will, for the most part, be written into New York City's charter.

Order Prevents City Interference

A temporary restraining order preventing the city of Milwaukee from interfering in any way with one-man car service on three of the city lines of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., was recently issued by Judge Schinz of the Circuit Court. The city claimed that one-man car operation was in violation of a 1914 ordinance requiring that every street car must be operated by a crew of at least two men. A warrant was recently sworn out charging a violation of this ordinance by the company. On the other hand the company claimed that it has been operating one-man car service with the permission of the Wisconsin Railroad Commission and that the city has no power to legislate over the matter. It therefore asked for a temporary restraining order and later to have the order made permanent.

City Responds to Railway Offer

The city of Kitchener, Ont., will offer the Waterloo-Wellington Railway, which operates between Kitchener and Bridgeport, $25,000 for its track, rolling stock and carhouse. The franchise expires in February and the company has asked the city either to grant a thirty-five-year franchise or to purchase the road.

The City Council will submit a bylaw to ratepayers to provide $70,000, of which $25,000 will be for the purchase of the assets of the road and the balance for equipment and operation in conjunction with the Kitchener & Waterloo Street Railway. W. H. Breithaupt, president of the road, wants $40,000 for the railway, but the city will only offer $25,000.

Buses to Be Tried in Toledo

The City Council of Toledo, Ohio, on recommendation of Street Railway Commissioner Wilfred E. Cann has authorized the Community Traction Company, to increase its capital by issuing $30,000 of preferred stock to provide funds to purchase four motor buses and provide housing facilities for them, the buses to be used in a service to be added to the Oak Street Railway line. The commissioner plans to purchase Garford equipment, each bus to have a seating capacity of twenty-five passengers.

Alleged Discrimination Stopped

The New York Central Railroad has decided to place the Northwestern Ohio Railway & Power Company on a parity with steam roads at Toledo, Ohio.

The railroad in the past has maintained a reciprocal switching tariff applicable between its tracks in Toledo, Ohio, and those of other steam railroads within the Toledo switching limits. The New York Central absolutely refused to consider switching between electric lines and its tracks on any other basis excepting as from an industry, the rate in which case was several times higher than that shown in its reciprocal switching tariff.

Immediately after the close of the Federal Railroad Administration the Northwestern Ohio Railway & Power Company filed an informal complaint covering this alleged discrimination with the Interstate Commerce Commission.

The conclusion to place the roads on a parity was based on the amount of business offered for interchange at that point and the equipment owned and operated was such as to make it impossible to classify same as an industry.

Mitten—A Hotel Promotor

Thomas E. Mitten, Philadelphia, chairman of the board of directors of the International Railway, Buffalo, N. Y., has subscribed to $10,000 of stock in the new $1,000,000 hotel which will be erected in Niagara Falls. The subscription was made on behalf of the International Railway because of the fair treatment accorded the company by the city during the recent railway strike, Mr. Mitten explained. The United Hotels Company will manage the structure. The fund for the erection of the building is being raised by the sale of stock. The Chamber of Commerce and the Niagara County Merchants' Association are co-operating.

Investigation On in Buffalo

Two secret indictments have been returned by the Federal Grand Jury in Buffalo in connection with the government investigation into the dynamiting of a high-speed train on the Buffalo-Niagara Falls interurban division of the International Railway last August. Colonel William J. Donovan, United States attorney for the western district of New York, who is in charge of the investigation being made by the United States department of justice, says the investigation has not yet been completed. Clarence F. Conroy, business agent of the Amalgamated in charge of the strike, was a witness before the Federal Grand Jury for forty minutes.

Whether or not the government investigation involves striking street car men and officers of the union has not been revealed by those in charge of the inquiry. Four men already are under arrest charged with the illegal possession of dynamite. One is Robert C. Lacey, former president of the Central Labor Council and state senator-elect from an East Side district. Lacey now is out under $5,000 bail. The International Railway Company has offered a cash reward of $100,000 for information leading to the arrest and conviction of those responsible for the dynamite outrages since the outset of the strike.

$195,000 for Power Betterments

A definite statement as to the purposes of the Minneapolis (Minn.) Street Railway has been made to the committee on street railways of the local Council by Vice President T. Julian McGill as to 1923 work. The program outlined will include $195,000 to be put into betterments of the power house, improvements of substations, reconstruction of rolling stock and cable work above and below ground. This leaves out of the renewal fund $500,000 for track extensions and paving between tracks. Of these extensions have been ordered as follows: Connection between the Twenty-fifth Street line and the Thirty-sixth Avenue line, five blocks, and extension of the latter line, to cost $170,000; extension of Monroe Street line, $17,000; Grand Avenue line, $43,900; Bloomington Avenue line, $54,500.

The proposed construction of several hundred light-weight cars, already announced, and the completion of other work will mean an expenditure of about $4,000,000, to cover which the company expects a market for its bonds after the rate decision is made by the State Railroad & Warehouse Commission. The addition of these cars depends, however, on the company getting additional funds.

An attempt of some of the Aldermen in attendance at the meeting to interrupt Mr. McGill was squelched when, in response to a statement by one of these Aldermen, Mr. McGill said that since April 1 no one had been discharged who had worked for the company two years or more.

Salary Expenditures Explained

James Couzens of Detroit recently addressed the annual dinner meeting of the Citizens' league at Grand Rapids. In the course of his remarks he called attention to a number of expense items that indicated an inflated overhead which he claimed bore the greater part of the responsibility for the high rates of fare in the operation of the Detroit street railway system. According to one of the Grand Rapids papers, Senator Couzens, then Mayor of Detroit, aroused the resentment of local city and street railway officials by suggesting that the city might find a remedy for the higher fare by investigating similar items.

In view of this circumstance City Manager Fred H. Locke, in co-operation with Louis J. DeLamarter, general manager of the Grand Rapids Railway, has made a study of many of these items as they apply to the Grand Rapids Railway Company and will publish a continuing report covering these factors as they apply to local charges.

The first of the series, signed by Mr. Locke, follows:

> There appears to be some misunderstanding or suspicion in the minds of some citizens relative to the financial affairs of the railway, and inasmuch as the operation of this company has to a considerable extent been placed under the control of the city manager, I will from time to time endeavor to give an account of the conditions as they actually exist.
>
> It has been related that the officials of certain street railway companies through high salaried officers have been milking the companies—that is, that they have taken in this manner from the stockholders and car riders the benefit of the earnings of said companies.
>
> It is reported and it is well known that in some cities large salaries have been and are being paid to the officials of public utilities including street railways.
>
> It has been hinted from certain quarters and by a few local citizens that such may be the condition existing here; in other words, that some of the officials and directors are drawing large salaries at the expense of the car riders.
>
> Under the terms of the franchise all operating and other expenses are subject to the approval of the city commission.
>
> As the city has full access to the books of the street railway company, the facts can be and have been ascertained and verified by an expert accountant for the city.
>
> The total of salaries paid by the local railway to its officials is as follows: President (in New York), vice-president and general manager, secretary and treasurer, assistant secretary and treasurer (in New York), comptroller, $18,200.
>
> The members of the board of directors receive $10 each for each meeting attended.
>
> It can be easily seen that the officials of the local street railway are not being overpaid, nor is Wall Street getting a rake-off through the payment of exorbitant salaries.

Action Delayed in Hollywood Case

It is estimated that it will be at least eighty days before the citizens of Hollywood, Calif., may expect any action of the California State Supreme Court on the matter of appeal made by the citizens to the courts for a decision of whether or not the city of Los Angeles or the State Railroad Commission has the power to order the Los Angeles Railway Corporation to extend its lines into Hollywood. It has been proposed that the West Sixth Street, the Vermont Avenue, the Heliotrope and the Temple Street lines be extended.

The Hollywood Chamber of Commerce recently petitioned the State Railroad Commission to order the Los Angeles Railway Corporation to extend its lines to Hollywood, as now served exclusively by the Pacific Electric local lines, but the state body stated that it was not certain of its authority to issue such order on the railway company, and the city of Los Angeles takes the same attitude under the terms of the existing city charter. Therefore, the matter was appealed to the Supreme Court for decision. Upon receiving the petition the court has requested the Hollywood Chamber of Commerce within thirty days from Dec. 6 to file briefs, the commission being given thirty days to answer and the Hollywood Chamber of Commerce twenty days to file another answer. The Supreme Court will then consider the case.

News Notes

Pamphlet Tells Four Years Story.—The Boston (Mass.) Elevated Railway has issued in pamphlet form the statistics on the four years' results under public operation. These figures were published in the *Electric Railway Journal*, issue of Aug. 5.

Trolley Service Started. — Railway service was recently established between Groton and New London by the Groton & Stonington Street Railway, Norwich, Conn. The line extends over the new Thames River bridge and opens up a service long desired.

Good Slogan Wins Prize.—"Any accident may be fatal" is the new slogan of the Boston (Mass.) Elevated Railway. The author of the phrase, now officially adopted, was awarded a $10 prize in a contest for employees, recently held by the company and in which a large number of men submitted suggestions.

Power Contract Approved.—The New Brunswick Government has approved a contract between the Provincial Electrical Power Commission and the city of St. John for the delivery of hydro power to the city from the Musquash plant. The signature of Lieutenant-Governor Pugsley has not yet been affixed to the contract.

Safety Week Saves Forty-seven.—The Safety Institute of America has issued its safety week bulletin, which gives the result of that important week in New York City, namely Oct. 8-14. There were only twenty-three deaths due to accidents compared with seventy for the same week in 1921. In other words, forty-seven lives were spared.

Arbitration Will Decide.—Arbitrators will be chosen to settle the differences existing between the Charleston (S. C.) Consolidated Railway & Lighting Company, and its employees. The contracting parties have been unable to reach an agreement with respect to working conditions and wages for 1923.

New Slogan in Fort Wayne.—The Indiana Service Corporation, Fort Wayne, Ind., has adopted an interesting slogan which is being used in all the company's advertising, in all of its literature and on all of its letterheads, billheads, envelopes, etc. This slogan is, "Service Is Our Middle Name."

Will Consider Wage Cut Appeal. — Trustees of the Boston (Mass.) Elevated Railway are expected to consider the appeal of the carmen's union for a postponement of the wage reduction scheduled for Jan. 1. The present arrangement was the result of a joint conference held last May, but according to the union's petition, costs of living have advanced to such an extent that the 2 cents an hour cut would work a hardship on the men. Operators of one-man cars now receive 73 cents an hour and the blue uniformed men 63 cents an hour.

Ordinance Demands "Stop" Lights.—An ordinance requiring the Cincinnati (Ohio) Traction Company to equip its cars with automatic rear stop lights has been introduced in the City Council by Councilman Otto K. Francis. The measure has been referred to the committee on street railways, which has scheduled it for a public hearing. By the terms of the proposed law the traction company is forced to equip half of its cars with rear lights within six months and all its cars with lights within a year. A provision of the ordinance demands that traction cars be operated with automatic stop lights.

Statistics on the First Pasenger Railroad.—An account of the bulletin for posting in cars and in other places, issued by the Georgia Railway & Power Company, Atlanta, Ga., called "The Empire State," has been published in previous issues of this paper. The issue of "The Empire State" for Dec. 11 brings out an interesting fact in regard to the first passenger railroad. The bulletin reads: "The first passenger railroad in the world ran from Augusta, Ga., to Charleston, S. C. The first trip was made in January, 1831. Now Georgia has 7,318 miles of railroad track, affording a network intercommunication and abundant outlets to the markets of the world. It is great to be a Georgian."

Speaks on Mitten Plan.—Dr. A. A. Mitten supervisor of industrial relations of the Philadelphia (Pa.) Rapid Transit Company was the speaker at the December meeting of the Industrial Relations Association of Buffalo. His address confined itself largely to the Mitten plan of collective bargaining, but he did touch upon the traction situation in Buffalo. He declared that the International Railway is now employing more men in the operation of cars than before the strike. Dr. Mitten was detailed to special service in Buffalo during the early months of the strike on the local and interurban lines of the International Railway. He was in charge of the health of the men held in carhouse camps and also in the sanitation of the camps.

Financial and Corporate

I.C.C. Act Interpretation

Electric Railways Oppose Steam Railroad Purchase Proposal from California at Washington Hearing

The Interstate Commerce Commission is expected soon to render its decision regarding the application of the Western Pacific Railroad for authority to acquire control of the Sacramento Northern Railroad, an electric system. In the determination of this case is involved a question of widespread interest to electric railroads in having decided the authority of the Interstate Commerce Commission over issuance of securities by interpretation of Paragraph I of Section 20a of the interstate commerce act.

The act, in this section, excepts from the authority of the Interstate Commerce Commission "a street, suburban, interurban electric railway which is not operated as a part of a general steam railroad of transportation." It is in the interpretation of these words that the greatest interest in the pending case rests.

Division Four of the Interstate Commerce Commission some time ago heard some of the questions bearing on this case and rendered a majority decision declaring, in effect, that the Sacramento Northern Railroad is not an interurban electric railroad, but probably an ordinary railroad operated by electricity, and therefore not excepted from the provisions of the law requiring an application to the Interstate Commerce Commission for permission to issue securities. Even if this were not so at present, Division Four held, acquisition of the Sacramento road by the Western Pacific would make it part of a steam railroad system. From this decision, an appeal was taken to the full commission.

At the hearing before the full commission, held on Dec. 6, four arguments were advanced in opposition to the decision of Division Four in interpreting the interstate commerce act, while one attorney appeared with notice that he desired to file a brief against the proposed merger on the basis of public interest if the division's decision were to be reversed. In opposition to the idea of including interurbans of the character of the Sacramento Northern within the securities-supervision jurisdiction of the Interstate Commerce Commission there appeared Carl Taylor of New York, representing the Western Pacific Railroad; Ben B. Cain, Washington, representing the American Short Line Railroad Association; Charles L. Henry, Washington, chairman of the committee on national relations of the American Electric Railway Association, and Frank Karr of Los Angeles, representing the California Electric Railway Association. Charles Warren, Washington, appeared as representative of Miles Standish, a minority stockholder of the Sacramento Northern Railroad, who opposes the transfer to the Western Pacific. Mr. Warren filed a brief, but made no argument on the point at immediate issue, although expressing approval of the finding of Division Four.

Arguments in favor of overturning the division's decision and against including electric lines within the commission's jurisdiction to supervise security issues were that Congress worded the act because parts of general steam railroad systems were electrified and that it was clearly intended to except interurbans, regardless of whether they handle freight or only passengers. It was shown that there is a difference between "control" and "operate" and that while, if the transfer takes place, the Sacramento Northern will be "controlled" by the Western Pacific, it will not be "operated" by that steam road. The Sacramento Northern does handle freight, but in its other activities is distinctly unlike a steam road.

This case arises because of an offer by the Western Pacific to acquire control of the Sacramento Northern. It was proposed that the Western Pacific issue $4,180,000 of bonds so that its holding company, the Western Pacific Railroad Corporation, might consummate the deal. Permission for this issue was granted by the Interstate Commerce Commisison in May, 1921, but without passing on the question of the right to acquire the Sacramento Northern and with the proviso that further application for such use of the proceeds must be made. It is proposed also that a holding corporation be created for the Sacramento Northern, because not all of its stocks and bonds can be purchased, all the stock in the holding company to be acquired by the Western Pacific Railroad Company as security for issues of securities. The California Railroad Commission has approved the application.

Part of North Shore Property Sold

The property of the New York & North Shore Traction Company, Roslyn, N. Y., outside of the limits of the city of New York, comprising tracks, power plant, cars and other appurtenances, has been sold to David Ziskind & Company, Lowell, Mass., for $125,000, subject to claims against the company for taxes. The purchaser has started dismantlement. On the part of the property within the city there remains a question to be settled—whether the claims of the city against the company come ahead of those of the bondholders. The receivers, Messrs. Allen and Moran, will remain in charge until the last of the matters in connection with the dissolution has been settled.

Reorganization Effected

West Virginia Property, in Receivership Since 1916, Has New Officers and Directors

New officers and new directors were named for the Morgantown & Wheeling Railway, Morgantown, W. Va., and the control of the road passed out of the hands of those who have held it since 1916 to a new faction which gained control of the majority of the stock at recent meetings of the stockholders, new directors and officers.

A resolution was passed by the stockholders to have the property and assets of the company returned to the stockholders. R. Hugh Jarvis was named vice-president of the company and statutory attorney.

Former Gov. W. E. Glasscock was named chairman of the meeting, with R. H. Jarvis secretary. A committee was named to examine the proxies and the number of shares represented and when those formalities had been disposed of the regular business was taken up.

The directors chosen were J. V. Thompson, Andrew A. Thompson, John R. Thompson, Uniontown; John F. Phillips, W. H. Conaway, Rolfe M. Hite of Fairmont and R. H. Jarvis, Frank P. Weaver and G. P. Russell of Morgantown.

The board of directors at a subsequent meeting named Josiah V. Thompson president, R. H. Jarvis vice-president and W. H. Conaway secretary and treasurer.

The railroad went into the hands of the receiver in 1916 following the institution of a suit by David E. Lemley and others. William E. Glasscock was the first receiver appointed by the court, followed by Raymond E. Kerr, and recently by Samuel Pursglove, the present incumbent.

The last record of a stockholders' meeting is that of Jan. 8, 1916, according to the vice-president.

The affairs of the railroad have been in confusion the past six years and suit after suit has been entered which has kept the case prominent in the court since that time. Large sums have been expended in court costs and attorneys' fees in that time and little if anything has been done to reduce the indebtedness of the road.

Early in the present year Samuel Pursglove, the present receiver, purchased for $162,500 bonds of the railroad of a par value of $325,000, with all the interest coupons attached that were held by the County Court. He is also said to have bought up practically all the other outstanding bonds at approximately the same rate and then asked the court, as the biggest creditor of the road, to be appointed receiver in place of Raymond E. Kerr, the incumbent at that time.

This marked the renewed activity in the affairs of the Morgantown & Wheeling which culminated in the reorganization meeting. The matter has been in progress since last April.

Details of Michigan United Reorganization

Outstanding Security Issues to Be Scaled Down Within Limits of Company's Earning Power—Earnings for First Ten Months This Year Sufficient to Pay New Bond Interest 1.55 Times

G. R. Cottrelle, chairman of the bondholders' protective committee, on Dec. 15 announced details of the reorganization plan of the Michigan United Railways, of which John F. Collins, the general manager, has just been made receiver. The statement outlining the plan was addressed to the depositors of the first and refunding mortgage bonds of the company under the bondholders' protective agreement, dated Nov. 8, 1921.

The plan provides for the formation of a new company, which will take over the property and assets of the old corporation. It will have an issue of first and refunding mortgage bonds to be known as Series A, of which $5,190,500 will be issued in exchange to depositors of the first and refunding mortgage 5s of the present company, and $1,800,000 will be given in exchange for the bonds of the Jackson & Battle Creek Traction Company.

The new concern will also have an issue of preferred stock, of which $6,000,000 will be given to depositors of the first and refunding 5s of the present company, while 100,000 shares of no par common will be issued in exchange for securities of the old company and for other purposes of reorganization.

Holders of the $10,381,000 old first and refunding 5s of the Michigan United Railways will receive 50 per cent of their face value in new twenty-five-year first refunding 5s and 50 per cent in new preferred stock. Holders of Jackson & Battle Creek first 5s and Jackson Consolidated Traction first 5s are to get 100 per cent face value of their holdings in the new bonds. Holders of the $703,800 debentures will receive one share of new common stock for each $100 face value of their holdings and the right to subscribe to the new bonds at 85. Those availing themselves of this privilege will receive one share of common stock in respect of each $50 subscribed and the further privilege of subscribing to additional common stock at $4 a share.

Present preferred shareholders are to get one-half share of common for each share of old preferred and the privilege of subscribing for bonds at 85 on the same basis as debenture holders with the additional privilege of a second subscription to common at $4 a share.

Common stockholders are to be given one-fifteenth of one share of new common for each share of old with subscription privileges similar to those of the preferred shareholders.

Subscription privileges under the plan expire on March 1, 1923, and time for deposit of stocks and bonds expires on Feb. 1, 1923.

The Michigan United Railways owns and operates the city street railway system in Kalamazoo, Battle Creek, Jackson and Lansing, Mich., the interurban lines connecting the cities mentioned, and also the interurbans from Lansing to St. Johns and Pine Lake and from Lansing to Owosso and Corunna; a total of 258 miles measured as single track. Passenger terminal stations are located in the main business sections of each city served. Through passenger service between these cities and Detroit is maintained over the lines of the Detroit United Railway from the city of Jackson, and direct connection with Grand Rapids is made through arrangements with the Michigan Railroad. Two hundred and seventy-eight cars are in operation.

The cities served by the company have shown steady and substantial growth, but the general depression which followed the period of war inflation was reflected in a marked degree in this industrial district. During the war years and for some time thereafter, all operating costs rose rapidly and to extreme levels. Further, with the development of good roads through central Michigan, the company has felt increasingly the competition of the unregulated jitney, the motor bus and the motor truck, as well as the diversion of a portion of its passenger business to the privately operated motor car.

A table of the earnings of the entire property and the bond interest charges against the same for the years 1912 to 1921, inclusive, and for ten months of 1922, follcws:

Year	Gross Earnings	Operating Expenses*	Operating Income	Mortgage Bond Interest
1912	$1,649,570	$1,025,027	$624,542	$519,900
1913	1,826,355	1,095,861	730,493	519,900
1914	1,801,696	1,069,263	732,433	527,095
1915	1,777,514	1,080,887	696,627	602,852
1916	2,067,591	1,269,550	798,041	621,969
1917	2,274,757	1,479,921	794,835	620,015
1918	2,320,737	1,751,416	569,321	622,399
1919	2,841,336	2,000,460	840,875	618,630
1920	3,160,152	2,576,600	583,652	620,595
1921	2,846,230	2,392,576	453,653	622,419
10 mos. 1922	2,268,102	1,804,049	464,052	516,113

* Includes taxes, rentals, current maintenance and repairs but not depreciation.

These figures show that the net earnings of the company, without provision being made for depreciation, are not sufficient to carry interest charges. As the reorganization committee points out, this fact, standing alone, shows the necessity of a reorganization of the property and a readjustment of its fixed charges. In addition to this, however, $1,200,000 face amount of 5 per cent bonds secured by a prior lien mortgage on the interurban division between Battle Creek and Jackson will become due on Jan. 1, 1923. The company is without funds to pay these bonds, and no securities are available with which the bonds can be refunded or which can be sold in the market for a price to produce the necessary amount. Furthermore, all bonds which may be issued for major extensions, betterments and improvements have been so issued. The company, therefore, is without means to finance extensions and improvements necessary to maintain its present business and develop the property in the future. The company is also in need of a substantial amount of additional cash with which to purchase the equipment presently operated under lease with option to purchase, and to carry on its business.

For these reasons the committee was forced to the conclusion that a reorganization is absolutely necessary and that a plan of reorganization must be devised and executed which in addition to yielding to bondholders the maximum advantage and protection possible, should also place the reorganized company in a position to meet the requirements to which reference has been made. The committee believes that the plan now presented does meet these conditions. Under this plan the interest charges against the property will be reduced to an amount which the earnings of the company should be sufficient to pay when due. For the twelve months periods ended Oct. 31, 1921 and 1922, the earnings of the property applicable to the reduced bond interest charges were as follows:

	1921	1922
Gross earnings	$2,905,777	$2,736,520
Operating expenses*	2,439,658	2,152,312
Operating income applicable to interest	$466,119	$584,208
Annual interest charges on $7,780,500 of mortgage bonded debt of the new company at 5 per cent		389,025
Balance		$195,183

* Including taxes, current maintenance and repairs, but not depreciation, or rentals on equipment now eased but proposed to be acquired in reorganization.

During the first ten months of the current calendar year the net earnings applicable to interest amounted to $500,733, as against the proposed mortgage bond interest charges for like period of $324,187, or 1.55 times mortgage bond interest requirements.

Under the terms of the new mortgage additional bonds are made available to the new company for financing necessary betterments, extensions and improvements. New money presently required by the new company will be supplied principally through the sale of $600,000 new bonds at 85 and accrued interest.

In a statement which he issued at Jackson Mr. Collins, the receiver, said in part:

> It is my intention to give service, same as heretofore, in the territory that I am acting as receiver for, providing the earnings will warrant the expenditure of operation in the future.
>
> When the Saginaw-Bay City Railway went into receivership, and later into bankruptcy, the receiver appointed ceased service, owing to the fact that the earnings did not warrant its continued operation.
>
> It is to be hoped that the lines of the Michigan United Railway will be patronized by the traveling public to provide sufficient funds to warrant operation, and that service can be continued.
>
> A great many street railroads throughout the United States are now in the hands of a receiver, this being brought about by the high cost of labor and material, as well as the development of automobiles, which have deprived the railways of a large amount of their previous earnings. Trucks and motor

buses being furnished free use of the highways by the taxpayer, handle a certain proportion of the freight and passenger business which heretofore went to the electric lines, as well as to the steam lines.

The receivership does not include the Michigan Railroad, which operates three interurban divisions between the following points: From Battle Creek to Allegan, Kalamazoo to Grand Rapids, Grand Rapids to Holland and Saugatuck, and from Bay City to Flint, which latter interurban division operates through cars to Detroit. J. F. Collins is vice-president and general manager of these three interurban divisions of the Michigan Railroad.

◆

Second Year Under Service-at-Cost More Successful

The New York State Railways in its second year of operation under service-at-cost in Rochester, fell short of reaching a full 6 per cent return by $94,000. This is the amount of return guaranteed to the company by the contract on the valuation of its property fixed at $19,298,602. The second annual report of Charles R. Barnes, city commissioner of railways, for the year ended July 31, 1922, submitted recently to the City Council, shows that the deficit for the second year is $38,999 less than it was a year ago. The total deficit is now $227,000. The report states that the lower deficit for the second year is encouraging in view of the promise it gives for a reduction in fare.

Total revenues amounted to $5,105,650, according to the report, while costs are shown to total $5,199,651.

The company received $1,156,098 as its return on its investment in Rochester. Under terms of the service-at-cost contract, the company gets a sliding scale of return each month on its total investment based upon the rate of fare. At a 7-cent fare rate, the company gets a return of 6 per cent. The base valuation as of July 31 was $19,298,602.

Operating expenses of the company totaled $3,725,000; taxes, $306,000. Total passengers carried numbered 98,976,000 and transfer passengers 23,731,000.

During the year $240,267 was put aside in the renewal and depreciation fund. Under the contract 2 per cent of the base value is charged off to this item. Last year $145,833 was so put aside. Of this total, $386,100, there remains $182,532 still on hand. Under the fund account, also, there is $135,144 on hand, the total cash on hand in various funds exceeding the present total deficit for the two years of operation under the service-at-cost plan. It is this fact which proves most satisfactory to city authorities, and gives rise to the hope that a reduction in fare soon may be realized.

Mr. Barnes tells about the studies of car service and the improvements made resulting in regularity of car movement.

According to the report accidents were greatly reduced. The number for the first year under the service-at-cost plan was 5,733 against 5,355 for the second year.

Operation Under Reorganization in Prospect

A final step in the negotiations looking toward a reorganization of the Atlantic Shore Railway, Sanford, Me., will be the decree in the United States District Court foreclosing several mortgages on the property.

Agreements have been made between all parties holding mortgages and the bondholders as well, to accept, after surrendering their securities, a proportional part of a new issue and to start a new operation of this railroad system with some prospect of success. Almost nine months ago efforts were started to accomplish this result and many conferences and short hearings have been held.

In order to salvage all that was possible for these investors, to give assurance of continuing the road as a going concern, it was essential that a single agreement be reached. That was done recently and decrees were drafted and submitted to Judge Peters, now busily occupied in the civil case on trial in the District Court.

Railway January Maturities Total $7,997,000

In the public utility field corporate maturities for January total $34,259,600, according to the *Wall Street Journal*. Many small amounts are included in this figure. The bonds of the electric railway companies which will be realized in January, 1923, amount to $7,997,000 and are listed herewith:

Jan. 1	Ohio Traction notes.	7	$1,878,000
Jan. 1	Lake Shore Electric Railway cons.	5	1,630,000
Jan. 1	Jackson & Battle Creek Traction 1st..	5	1,200,000
Jan. 1	West End Street Railway 1st	4½	700,000
Jan. 1	Charleston City Railway 1st	5	680,000
Jan. 1	Milford & Uxbridge Street Railway 1st..	5	335,000
Jan. 1	Eastern Mass. Street Railway ref.	6	300,000
Jan. 1	Jamestown Street Railway 1st	6	300,000
Jan. 1	Jersey City & Bergen Railroad 1st....	4½	258,000
Jan. 1	Interurban Railway deb.	6	250,000
Jan. 1	Webster, Monessen, Belle Vernon & Fayette City Street Railway	6	250,000
Jan. 1	Oskaloosa Traction & Light 1st	5	216,000
	January total		$7,997,000

Securities Sold at Auction

Electric railway securities sold by Adrian H. Muller & Company on Dec. 6 at the Public Auction Room, 14 Vesey Street, New York, were as follows:

$25,000 Oakland Railways Co. collateral trust 6% bonds, 1913, certificate of deposit; per cent 45⅜

$2,000 Milford & Uxbridge Street Ry. first mortgage 5s extended to 7% bonds, 1923; per cent 58

$6,000 Columbus & Ninth Avenue R.R. first mortgage 5% bonds, 1933, certificates of deposit; per cent....................14

$7,000 Columbus & Ninth Avenue R.R. first mortgage 5% bonds, 1933, certificates of deposit; per cent 15

$30,000 28th and 29th Street Railroad Company first mortgage 5% stamped bonds certificates of deposit; lot...........$20

$28,000 Chicago Elevated Ry. Co. 6 per cent deb. bonds, 1924, with coupon attached; per cent 14

1,000 shares Chicago City and Connecting Ry. Co. collateral trust participating preferred certificates; per share.......$3.50

Financial News Notes

Northern Ohio Bonds Offered.—The National City Company, New York, N. Y., is offering an issue of $1,000,000 general and refunding mortgage 6 per cent bonds, Series A, of the Northern Ohio Traction & Light Company, Akron, Ohio, due in 1947, at a price of 94 and accrued interest, to yield 6½ per cent.

Authorized Issue of Preferred Increased.—The directors of the Standard Gas & Electric Company, Chicago, Ill., have authorized the issue of $2,460,000 new 8 per cent cumulative preferred stock of $50 par value to take care of various conversion privileges of the company's funded debt and to provide capital for increased business. Stockholders rights to subscribe will expire Jan. 31, 1923.

Holding Company Preferred Offered.—Bonbright & Company, New York, N. Y., head a syndicate which is offering an additional $5,000,000 of 6 per cent cumulative preferred stock of the Electric Bond & Share Company. The offering price is 97 and accrued dividends, from Nov. 1, 1922, to yield about 6.20 per cent. The proceeds will be used to expand the business of the company and for general corporate purposes. Upon completion of the sale the company will have outstanding $16,200,000 preferred stock of an authorized issue of $20,000,000.

Venner Verdict Affirmed.—The Appellate Division of the Supreme Court in the matter of Clarence H. Venner against the Interborough Rapid Transit Company, New York, N. Y., has affirmed the judgment of Justice Davis of the special term of Supreme Court in substance granting to Mr. Venner a judgment against the defendant for $25,000 with interest at 7 per cent, from Sept. 1. 1921. The plaintiff was owner of twenty-five promissory notes of $1,000 each carrying 7 per cent interest, issued by the defendant as part of $33,400,000 of notes, dated Sept. 1, 1918, due Sept. 1, 1921.

Change in Stock Provisions Approved.—The stockholders of the Public Service Corporation of New Jersey, Newark, N. J., have approved the change in the charter dividing the authorized $50,000,000 preferred stock into two classes—one of 250,000 shares, 8 per cent cumulative preferred, and the other of 250,000 shares, 7 per cent cumulative preferred. This change is in accordance with the recommendation of the directors. They felt that there would be times hereafter when it would be practicable for the corporation to sell 7 per cent preferred stock. Reference to the intended change was made in the issue of the *Electric Railway Journal* for Nov. 25, page 862.

Traffic and Transportation

Railway Offers Five-Cent Fare as Experiment

The city of Bellingham has been granted a 5-cent fare on its car lines, according to a voluntary offer of the Puget Sound Power & Light Company. Under the provisions of the company's offer, the fare will be tried out as an experiment for ninety days, and the company will sell tokens at the rate of twenty for $1, valid until used by the buyer. It was planned to put the new arrangement into effect on Dec. 17.

The company's action came as a complete surprise to city officials, who four months ago had conferred with company officials in an effort to reduce the fare, and had finally agreed to let the matter rest for a time. Under the new plan, the passes now in use will be discontinued and every one will be requested to use tickets. The traction company will undertake an extensive advertising campaign to popularize the new system, with the hope of making the idea a permanent one. In a letter addressed to the City Council, notifying that body of the new carfare, the company, through Manager Harry B. Sewall of the Bellingham division, calls attention to the fact that with the exception of the commutation tickets provided for no other changes in fare will be undertaken, the cash fare remaining at 7 cents for adults and 2½ cents for school children.

Attention was also called to the fact that when the city and company officials conferred on fare problems in September the Council was "not unwilling to approve of such tickets being limited to certain hours in the morning; that is, from 6 to 9 o'clock, and certain hours in the evening, from 4 to 7," but that the company had decided that no limitation of hours in which the reduced fare might be used would be set.

It is pointed out that the ninety days embracing the holiday season and the period of inclement weather would naturally be the most favorable period in which to determine whether such a rate will, as the City Councilmen believe, justify the substantial carfare reduction. Company officials express doubt that the expected increase in travel will offset the reduction in rates, but state that if such increase develops the 5-cent tickets will be continued.

Fare Increase Refused

Expressing the view that with service changes and economy a reasonable return can be earned, the Railroad Commission of California has dismissed the application of the Bakersfield & Kern Electric Railway for an increase in fares in Bakersfield. In the event that conditions should make impossible the expected savings, the company will be permitted to renew its application.

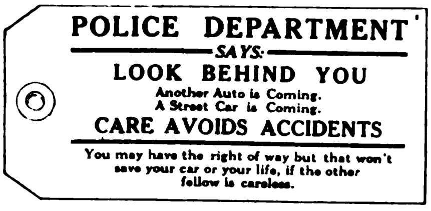
The commission found a rate base of $568,314 upon which it was calculated the company is earning at the present time the rate of return of 3.52 per cent. With suggested savings in operation this return, it was computed, could be increased to 5.82 per cent. The commission was urged by the Boosters Club to order an extension of the system to serve East Bakersfield, but no order was made on this matter pending a separate consideration of grade crossing problems involved.

In commenting on this matter the commission said:

> This commission has, we believe, the power to order an extension, but such an order cannot be made where the evidence indicates the extension would be operated at a loss, and as to an increase in fare designed to take care of such a loss, it must be obvious that this cannot be determined until the cost of the facilities necessary is found, and since the crossing of the Southern Pacific may add to the costs above stated, it is impossible at this time even to estimate the added operating costs which will undoubtedly result from rail service into East Bakersfield.

Tags for the Purpose of Accident Prevention

The tag reproduced herewith is part of the Accident Prevention work carried on by the Elmira Water, Light & Railroad Company, Elmira, N. Y. The company had the tags printed and is having them tied on the steering wheels of all automobiles in the downtown section.



POLICE DEPARTMENT

SAYS:

LOOK BEHIND YOU

Another Auto is Coming.
A Street Car is Coming.

CARE AVOIDS ACCIDENTS

You may have the right of way but that won't save your car or your life, if the other fellow is careless.

Hearing Held on Freight Traffic Discontinuance

Public Service Commissioner William R. Pooley has reserved decision on the application of the International Railway, Buffalo, N. Y., to abandon its freight traffic in western New York. The company asks to discontinue this arm of its service altogether. C. P. Franchot, counsel for the International, explained that the purpose of the move was to cease making a gift to shippers of service at less than cost and to cease to lay the burden incurred by this business on the passenger business.

Several representatives of Chambers of Commerce in western New York attended the hearing and there was some objection to the railway's plan. The International maintains a freight and express station at Main and Virginia Streets and operates a number of interurban freight and express cars between Buffalo, Niagara Falls, Lockport and Olcott and intermediate points.

Passenger and Freight Interchange Arranged

Arrangements have just been completed between the Nickel Plate (steam road) and the Northern Ohio Traction & Light Company (electric system) whereby freight and passengers will be handled from points on the Northern Ohio Traction & Light Company's lines to Chicago and intermediate points on the Nickel Plate and to points west and south of Chicago over connecting steam lines. This is one of the few arrangements of its kind to be perfected in this country between an electric line and a steam road. The tariffs were filed with the Interstate Commerce Commission on Dec. 15 to become effective on Jan. 15, 1923. This action on the part of the Northern Ohio Traction & Light Company opens the way for freight shipments from points on its lines to all points west via the Nickel Plate.

Commission Reports Further on Traffic Congestion

In connection with the activities and surveys of the Los Angeles Traffic Commission to determine practical methods and schemes to be adopted for relieving the traffic congestion in the business district of the city of Los Angeles a recent survey just concluded by the commission reveals some very interesting data in connection with these conditions. Following are some of the contributory causes of congestion, which include the growth of the city and the increase in number of automobiles.

In 1919 there were 62,000 automobiles registered in the city of Los Angeles. On Dec. 1, 1922, the city's automobile registration was in excess of 165,000. In the 1900 government census Los Angeles ranked as thirty-fifth in population among the cities of the United States. The government census of 1920 ranked Los Angeles the eleventh largest city in population.

During October, 1922, a total of 4,079 traffic accidents were recorded in Los Angeles by the police department, as against 2,047 in October, 1921.

In 1921 the death rate from automobile accidents in Los Angeles per 100,000 population was 27.9, as against:

For the whole United States	11.5
Average of all large cities	15.0
Manhattan	18.8
Chicago	20.3

Based on recent checks, the following volumes of traffic are handled daily between the hours of 5 to 6 p.m. at Seventh and Broadway:

Pedestrians	18,000	to	20,000
Automobiles	1,200	to	1,400
Street cars	320	to	350

The intersection of Seventh and Broadway handles the largest volume of automobile traffic in the downtown district. From 7 a.m. to 6 p.m. shows a total of 13,468 passing automobiles.

Fifth and Broadway is the busiest intersection in point of pedestrian traffic, checks showing a maximum of approximately 25,000 pedestrians per hour, as against a maximum of 23,000 at Seventh and Broadway.

Company Will File Supplementary Brief

A delay of sixty days or longer is likely before a decision is made in the litigation arising out of the fare fight in Fort Worth, Tex. This is indicated in the announcement by counsel for the Northern Texas Traction Company that the company would file a supplementary brief. The case was recently heard before N. A. Dodge, special master, who gave attorneys for both sides thirty days in which to file briefs in the case.

In the litigation, the city of Fort Worth seeks to compel the Northern Texas Traction Company to reduce fares from 7 cents to 5 cents claiming that increased patronage arising out of a 5-cent fare would more than offset the reduction in revenue brought about by a reduction from 7 cents to 5 cents. Under its franchise provisions, the Northern Texas Traction Company can charge any fare deemed adequate to produce a fair return on the invested capital, and during the period of high prices and low revenues the company announced a 7-cent fare. The city at once began a fight to compel a reduction, whereupon the company went into Federal Court to seek relief, setting forth that a 5-cent fare is confiscatory and that a 7-cent fare is necessary to produce a fair return on the invested capital.

N. A. Dodge was appointed as special master and after extensive hearings, in the course of which all phases of the operation of street car lines in Fort Worth were investigated, announced that he would give counsel for both sides thirty days in which to file briefs, after which he would render his decision. These briefs were filed nearly a month ago, and now before the referee has rendered his decision comes the announcement from the traction company that it will file a supplementary brief.

Recommends Consolidation With Uniform Fare

The question of uniform street car rates in the Twin Cities (Minn.) has come to a head in St. Paul in the report of the subdivision on public utilities of the St. Paul Association of Public and Business Affairs, as approved by the board of directors. This report reads:

> 1. The subdivision on public utilities is agreed that it is important that the rates of fare for street railway transportation shall be uniform in the cities of St. Paul and Minneapolis.
>
> 2. The subdivision recommends a consolidation into one operating company of the St. Paul City Railway Company, the Minneapolis Street Railway Company and subsidiary companies operating street railway lines within, between and out of the cities of St. Paul and Minneapolis and that a metropolitan transit district be established which shall consist of all territory now being served for one fare by the Minneapolis Street Railway Company combined with all territory now being served for one fare by the St. Paul City Railway Company, in which said metropolitan transit district only a single fare shall be collected from any point to any other point therein, together with transit privileges to all connecting lines.
>
> It is apparent a proper solution of this situation cannot be accomplished without a unification or consolidation of these lines. Their unification or consolidation is an absolutely necessary essential to accomplish any of the objects above specified. Without such action the Railroad & Warehouse Commission is without power to fix such uniform rates and, even if it were by legislation given the power, the grant in our opinion would be invalid.

The fare in either city is now 6 cents, to the city limits separating St. Paul and Minneapolis, but the fare in either city has been determined in the past by City Council action. Under the new law of the state the Railroad & Warehouse Commission has the power of establishing a fair fare rate return on the valuation of the property of the railway, so that the 6-cent fare rate in the Twin Cities is now an emergency or temporary rate until hearings shall be set and accomplished on the property valuations to be presented to the commission for action.

Speed Limits Fixed—Limited Service Continued

A speed limit has been fixed by the Massachusetts Department of Public Utilities for the cars of the Springfield Street Railway and the Holyoke Street Railway, over a section where the service and the speed became a matter of investigation.

The residents of a section of West Springfield and the residents of a section of Holyoke, Mass., asked for the discontinuance of the limited stop service between the two cities, and a speed limit of not more than 20 m.p.h.

In its investigation the department found that the cars operating on the limited stop basis had the tracks on the side of the road, where there are not many buildings and not many grade crossings, and it decided that 25 m.p.h. would be reasonably safe. It issued an order to this effect, and that the cars should reduce to 10 miles at certain crossings, to 5 miles when approaching school children and come to a stop before passing a car loading or unloading. The petition that the limited service be discontinued was dismissed.

An investigation of accidents covering 1,495 days before the limited stops arrangement went into effect in West Springfield showed seventy-seven accidents; during the 1,495 days after the limited stops were adopted there were eighty-three accidents, but forty-two of them were due to local cars. There were 6.29 accidents per 100,000 car-miles with limited stops and 8.82 accidents per 100,000 car-miles with local cars.

Buses Replace Cars

A new era in city transportation began in Everett, Wash., on Dec. 1, when the first gasoline-power buses replaced some of the electric street cars of the Puget Sound International Railway & Power Company with a 5-cent fare on the buses and on all electric lines, and the weekly $1 pass on all street car lines. The motor buses started on the Colby Avenue line first, the new service extending considerably beyond the outward terminal of the electric line, giving service to new territory.

Transportation News Notes

Seeks to Operate Buses.—The South Carolina Gas & Electric Company, Spartanburg, S. C., has petitioned the City Council to operate buses in connection with its local railway system.

Reduced Transfer Charge Allowed.—The Alabama Public Service Commission has granted permission to the Mobile Light & Railroad Company, Mobile, Ala., to reduce its transfer charge from 2 cents to 1 cent. The company applied for this privilege on Oct. 18.

"Stop" Signs on Cars.—The Nashville Railway & Light Company, Nashville, Tenn., is equipping its cars with semaphore signs reading "stop." This act is the latest move on the part of the railway company to lower the number of street or traffic accidents. The "stop" signs will serve as signals to automobile drivers not to pass a standing car.

Rule of Road Changed.—On Dec. 1 the rule of the road was changed from left to right in New Brunswick. The car lines in Moncton and in St. John and suburbs were changed to the right drive and the cars were operated vice versa from the way they have always been operated in New Brunswick. It is believed that accidents can be reduced to a minimum by the advertising campaign that is being conducted by the New Brunswick Department of Public Works.

5,965 Passes per Week.—The sale of weekly tickets by the Indiana Service Corporation in Fort Wayne, Ind., has reached a maximum of 5,965 per week, according to Robert M. Feustel, president of the corporation. This figure was reached in the forty-first week of the system. Officials of the company expect the sale will reach the 7,500 mark in a few weeks. A campaign is now on to increase the sales to 10,000 per week. The first week in which the pass was in use the sale totaled 2,800.

Proposes Seven-Cent Fare.—A new proposition has been placed before the City Council of Danville, Va., by the Danville Traction & Power Company. Instead of urging the one-man car issue, which has been before the Council and the public for the past three months, the company through its president, C. G. Holland, proposed that if the Council were unwilling to sanction use of one-man cars the company would be satisfied with a 7-cent cash fare and with the present ticket rate of five for 30 cents. The Council, therefore, voted to adopt a resolution providing for the publication of a change in the ordinance raising the cash fare from 6 cents to 7 cents. The Council at the same time charged the finance committee with making a definite recommendation as to the one-man car or the 7-cent fare.

Personal Mention

Mr. Harton Heads Kentucky Operators

William H. Harton, Newport, was elected president of the Kentucky Association of Public Utilities, at Lexington, Ky., Dec. 12. Mr. Harton is general manager of the South Covington & Cincinnati Street Railway with offices in Covington. He was promoted to this office after having served for several years as superintendent of transportation. He has been with the Green Line company for many years, and has reached his present position through a series of promotions resulting from efficient service. He is one of the active members of the Covington Rotary Club. He was one of the organizers of the Covington Penny Clinic, and acted as treasurer of that organization during the campaign to raise funds to establish the clinic. Mr. Harton is widely known in transportation circles.

Change in Pacific Electric Personnel

C. Mort Stuart, manager of the Pacific Electric Railway Company Club, Los Angeles, Calif., has resigned to enter other fields. N. B. Vickery has been appointed to the position vacated by Mr. Stuart. H. D. Priest has been appointed manager of Alpine Tavern Resort as operated by the company at the terminus of its Mount Lowe line, vice Mr. Vickery. N. B. Vickery commenced service with the Pacific Electric lines in 1905, serving in various capacities until his appointment as manager of Alpine Tavern in February, 1916. Mr. Vickery was one of the original organizers of the Pacific Electric Club, which places him in a familiar position with his new duties.

H. D. Priest, who succeeds Mr. Vickery as manager of Alpine Tavern, entered the services of the company in the passenger department in the year 1916. Previous to his present appointment he was employed as traveling passenger agent. In his new position he will return to a field of endeavor in which he has had much experience, having followed hostelry work for many years previous to his connection with the Pacific Electric Railway.

Glenn H. Shaw with Northern Ohio Company

The Northern Ohio Traction & Light Company established an accident prevention department with Glenn H. Shaw, formerly of the Cleveland Railway, in charge. Associated with Mr. Shaw as accident prevention supervisors are Charles Speigle for the northern division; C. J. France for the Akron city lines; H. L. Farmer for the southern interurban division, and Hugh Wilson for Canton and Massillon city lines.

The plan calls for committees from various departments of the system to work in conjunction with the superintendent and supervisors. There is also an executive committee, consisting of the head of the railway, light and power and commercial departments in conjunction with the general manager.

Mr. Reynolds Resigns

Manager of United Traction and Hudson Valley Railways, at Albany, Retired on Dec. 16

Albert E. Reynolds, general manager of the United Traction Company, Albany, N. Y., resigned on Dec. 16 to enter other business. The successor to Mr. Reynolds is Ernest G. Murphy, who has been assistant general manager.

A. E. REYNOLDS

Mr. Reynolds began his street railway career in Plattsburgh, N. Y., and was for several years manager for the Plattsburgh Traction Company, a subsidiary of the Delaware & Hudson Company, his management of that system being such as to attract the attention of the officers of the holding company, and in recognition of his valuable services they promoted him to the management of the Hudson Valley line, with headquarters at Glens Falls. At the time that he assumed the management of the affairs of this company conditions along the line were anything but pleasant and encouraging. The company had in some manner secured the enmity of many of the people along the line, and the system was not in the best of shape. He set about at once to correct these things and quickly succeeded in doing so.

With the reputation thus established it was quite logical that Mr. Reynolds should be appointed in 1917 to succeed Charles F. Hewitt as general manager of the United Traction Company, for both that company and the Hudson Valley line are controlled by the Delaware & Hudson Company. Upon the resignation of Mr. Hewitt, Mr. Reynolds, in fact, received the title of acting general manager at Albany, but in February, 1918, was formally made manager. Thereafter he continued in charge of both the Hudson Valley Railway and the United Traction Company with offices in Albany.

Cited for Bravery

Willard Cope, secretary of the committee on public utilities information of Atlanta, and former newspaper man in Atlanta, was paid a glowing tribute by the Georgia Industrial Commission in a report awarding Mr. Cope compensation under the recent workmen's compensation act for injuries suffered in a railroad wreck some months ago. At the time of the accident Mr. Cope was on duty as a reporter for an Atlanta newspaper. He was pinned beneath the wreckage in such a way that his entire body except his head was submerged beneath the water. At the same time he was badly crushed and bruised, his left leg was broken and his shoulder fractured. When rescuers arrived he told them to get the women and children out first. It was several hours before Mr. Cope was finally extricated. As a result of the injuries he received in the accident Mr. Cope was confined to his bed in the hospital four months. The report of the commissioner, Hal M. Stanley, said:

"We have here one of the most conspicuous examples of bravery that has been brought to the attention of the Industrial Commission since the Georgia workmen's compensation act was enacted into law."

Detroit Work Divided Among Commissioners

William B. Mayo, chief engineer for Henry Ford, will not assume the management of the Detroit Municipal Railway, as was stated in newspaper articles, but will take over only part of the duties in the same manner as the other two commissioners.

Mr. Mayo has been a member of the commission for some years and the work of the street railway department has been divided so that he, G. O. Ellis and H. H. Esselstyn, the other commissioners, will participate in the management.

The three commissioners have ararranged to divide the work as a temporary plan to be worked out for thirty days. The city will construct fifty new trailers in the Highland Park shops and it is understood that Mr. Mayo will assume supervision of this work. A. C. Colby, superintendent of equipment, will be actively in charge of this work. Ross Schram, assistant general manager of the Municipal Railway, also announced that the city was considering the advisability of constructing its own motor cars.

The commission also will institute a plan whereby motormen will receive a bonus for the safe operation of their cars. This plan is being instituted by the commission as a means of preventing accidents.

Mr. Brooks Goes Into Automobile Business

Charles A. Brooks, local manager of the Poughkeepsie City & Wappingers Falls Electric Railway, Poughkeepsie, N. Y., has resigned from that company to go into the automobile business for himself in that city. He will act as local agent for a well-known make of car and in addition conduct a general supply and repair business. This is a logical move by Mr. Brooks. He has long been an auto enthusiast, and this with his long experience in mechanical work make a rare combination of talent. It is nearly ten years since Mr. Brooks entered the employ of the local railway at Poughkeepsie. In fact, it was in April, 1913, to be exact, that he entered the service of the company there. Before that he had been engaged in similar work, mostly on the mechanical side, with the Third Avenue Railway, New York, the South Shore Traction Company, New York, and on properties in the Central West.

James P. Barnes, president of the Louisville (Ky.) Railway, has been nominated for re-election as a director of the Louisville Industrial Foundation, the so-called $1,000,000 factory-getting enterprise of Louisville. It was founded a few years ago to aid in bringing industries to the city.

Obituary

W. B. Everest, general traffic manager of the Westinghouse Electric & Manufacturing Company, died on Dec. 5. He had been holding the position of general traffic manager since 1914.

William C. Smith, for many years claim agent for the International Railway, Buffalo, N. Y., is dead. Mr. Smith resigned from the International Railway some years ago and at the time of his death he was associated with the Merchants' Mutual Casualty & Liability Company of New York City. He was fifty-two years old. Mr. Smith was a graduate of the Buffalo Law School and played an active part in Masonic affairs in Buffalo.

Gen. Luke Wright of Memphis, Tenn., eminent lawyer, is dead following an illness of several weeks from paralysis. General Wright had served as Secretary of War, Ambassador to Japan and Governor-General of the Philippine Islands in his relation to the federal government. Before that he had served as attorney general of Shelby County and practiced law with great success at the Memphis bar for a decade. General Wright served as counsel for the Memphis Street Railway and was a director of the Memphis *Commercial Appeal.*

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE
MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Production Advancing

Continued advances in production, transportation and distribution in November are noted in figures compiled by the Department of Commerce in its "Survey of Current Business." The largest consumption of cotton since 1917, and further high records since 1920 in the output of pig iron, steel ingots, zinc, coke, locomotives, and upper leather, emphasize the sustained and basic character of industrial production in November. The usual seasonal decline in building contracts in November failed to materialize.

The car shortage on the railroads was slightly relieved, but coal cars were still in great demand and coal loadings have been kept up to the maximum; total loadings of all classes were very high for November. Increased orders were made for locomotives and freight cars to overcome congestion.

Price levels continued to increase in November, with both the total wholesale and the retail food indices the highest since the end of 1921.

The final crop reports for the year 1922 indicate a large production of the principal crops, especially wheat, potatoes, corn and rye, and should make for increased prosperity in the farming sections.

Seek Authority to Purchase Sixty More Cars

The Pittsburgh (Pa.) Railways, through Receivers Fagan, George and Tove, has petitioned the court for authority to purchase sixty more cars, making a total of 125 new cars costing $1,450,000 within two years.

The sixty new cars are expected to cost $660,000. They will be delivered as completed during the next six months.

As the seating capacity of each car is fifty-nine passengers, the 125 new cars, those already purchased and put into service, with the sixty to be ordered now, provide 7,375 additional seats.

The new cars, like the previous purchases, will be the standardized double-truck, low-floor, low-step cars, with automatic doors and other approved equipment.

"Al" Green Returns to Galena Company

Galena Signal Oil Company, Franklin, Pa., has announced the return of A. A. Green to the position of sales and engineering representative. Mr. Green has long been connected with the industry, first on the operating and then for a number of years on the supply side. After passing thirteen years with the Galena organization, in 1917 he went over to the Columbia Machine Works, Brooklyn, as general sales manager, from which position he returns to the Galena company. He has been associated with the Brush Electric Company, the Memphis Electric & Power Company and the Rochester Railways, now known as the New York State Railways. Mr. Green has made a special study of the subject of lubrication and has contributed articles on that topic to this paper.

New Freight Equipment for Pacific Electric Railway

Rapid growth of its freight business necessitates the Pacific Electric Railway, Los Angeles, Calif., placing orders for new freight equipment, representing an approximate expenditure of $1,500,000.

The present freight equipment will be augmented through the purchase of 400 new dump cars, 150 flats and 200 box cars. A new freight switching electric locomotive is being constructed in the company's shops at Torrance, which will be a duplicate of the present 1,600 class type of freight locomotive used on the company's lines. A steam switching locomotive has just been purchased and placed in service at Los Angeles harbor to assist the present gas-electric locomotives now used by the company at that point in switching at the municipal docks and on the municipal tracks of Los Angeles, all of which switching is performed by the Pacific Electric Railway for the city of Los Angeles and the steam road lines serving the harbor.

United Electric Railways Installs Automatic Block Signaling

The United Electric Railways, Providence, R. I. is installing automatic block signaling on its line between Providence and Woonsocket. The complete installation involves a total of thirty-two protected blocks using signals of the Union color light type, Style "N" with all units provided for three color indications. Ten "DW" Automatic Flagmen (3 aspect) with Crossing Bells, all operating on alternating current, are being installed at various highway crossings in this territory and are incorporated as a part of the signal system.

The entire installation is supplied with energy by means of 2,300-volt 25-cycle, single-phase transmission which will be served from a transmission located approximately in the center of the signaled territory. The Union Switch & Signal Company has the contract for the complete erection of this signal system.

Westinghouse to Decide on Huge California Plant

Whether a $1,000,000 assembling plant for the Westinghouse Electric & Manufacturing Company shall be built in Los Angeles or at a point on the San Francisco Bay will be decided, says information from the East, by officers of the company at New York. H. D. Shute and H. P. Davis, vice-presidents of the electric manufacturing company, are just returning to the East after a visit to the Pacific Coast, where they have been investigating their interests, having visited Los Angeles and San Francisco, where were presented to them the claims of both cities as to advantages as the Western distributing point for the company. The Westinghouse company has already established in Los Angeles its general Western offices and headquarters and has just completed the erection of large buildings in San Pedro Street to serve those purposes.

Large Track Projects Completed

The New York State Railways, Rochester, N. Y., during its second year of operation under the service-at-cost plan completed the following track projects:

1. Construction of track in Clinton Avenue north, Norton Street to Ridge Road; 4,800 ft. of track.
2. Reconstruction of track in Clinton Avenue south, Court Street to Monroe Avenue; 625 ft. of track.
3. Reconstruction of track in Central Avenue; 1,050 ft. of track.
4. Reconstruction of track in Main Street east, Winton Road to Culver Road; 9,940 ft. of track.
5. Replacement of light tee rail on Charlotte line with heavy tee rail; 4,500 ft.
6. Replacement of wood-block paving along rails in Genesee Street; 10,200 ft. of track.
7. Installing cross-over in Central Park, near North Goodman Street.

Increase in Power Resources

An increase of 30 per cent in the total power resources of the Indiana Service Corporation, Fort Wayne, Ind., is reported with the placing in full commission at the power house in Fort Wayne of the new 6,000-kw. steam turbine, which has been under construction for several months. The addition of this equipment gives the plant a total of 20,000 kw. capacity. Installation of a 12,500-kw. turbine, at a cost of $500,000, during the coming year is also being considered by the traction company officials.

Metal, Coal and Material Prices

Metals—New York	Dec. 19, 1922
Copper, electrolytic, cents per lb.	146.25
Copper wire base, cents per lb.	16.50
Lead, cents per lb.	7.25
Zinc, cents per lb.	7.30
Tin, Straits, cents per lb.	38.125
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$7.875
Somerset mine run, Boston, net tons	4.125
Pittsburgh mine run, Pittsburgh, net tons	2.625
Franklin, Ill., screenings, Chicago, net tons	2.70
Central, Ill., screenings, Chicago, net tons	2.00
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No 14, per 1,000 ft	6.50
Weatherproof wire base, N.Y., cents per lb.	16.50
Cement, Chicago net prices, without bags.	$2.20
Linseed oil (5-bbl. lots), N.Y., cents per gal.	93.00
White lead, (100-lb. keg), N.Y., cents per lb.	12.125
Turpentine, (bbl. lots), N.Y., per gal.	$1.38

Rolling Stock

Maumee Valley Railway, Toledo, Ohio, has ordered seven one-man cars from the Cincinnati Car Company.

Interborough Rapid Transit Company, New York, N. Y., plans to convert 465 cars with new conveniences and comforts. The new cars will have vestibules and sliding doors with glass panels.

West Penn Railways, Pittsburgh, Pa., has placed an order for 161 Economy watt-hour meters with car inspection dials for use on its coke region and other divisions. This order follows earlier purchases totaling seventy-four Economy meters.

Boston (Mass.) Elevated Railway has placed an order for thirty motor equipments and control with the General Electric Company. These equipments will be General Electric 264A motors and K-71 control. They are intended for use on some of the cars the railway is now having built at the plant of the Laconia Car Works.

Los Angeles (Calif.) Railway has ordered twenty-five more cars of the two-car train type. The bodies and trucks are being purchased from the St. Louis Car Company and the electrical and air brake equipment will be installed at the South Park shops. The cars cost in excess of $15,000 each. Delivery of the cars is scheduled to start next May. This order will give the Los Angeles Railway 100 cars which will be suitable for two-car train operation.

Track and Roadway

Salt Lake, Garfield & Western Railway, Salt Lake City, Utah, has extended its lines to Garfield, Utah.

Hydro-Electric Commission, Windsor, Ont., has been authorized by the City Council to proceed with the construction of a single track on Sandwich Street east. Work is already under way.

Little Rock Railway & Electric Company, Little Rock, Ark., is spending $70,000 on new rails and construction work on Main Street. Standard rail is being used. The city is repaving from Markham to Ninth Streets and the company will later pave between its tracks.

Savannah Electric & Power Company, Savannah, Ga., during the first nine months of this year completed 23,131 yards of paving between its tracks and 2 ft. outside on West Broad, Bay, Habersham, Abercorn and Gurnnett Streets on account of the paving or repaving of those thoroughfares.

New York, N. Y.—Work has started on the contracts to alter the Bridge Plaza rapid transit station, Long Island City, to permit dual operation of the Astoria and Corona extensions in Queens Borough by the Brooklyn (N. Y.) Rapid Transit trains as well as the Interborough trains. The Board of Estimate approved the necessary appropriation of $107,000 at its meeting on Nov. 10. The contracts have been executed by the Transit Commission—one with the New York Municipal Railway Corporation for the laying of extra tracks to permit the operation of shuttle trains, and the other with the Jobson-Gifford Corporation for the construction of the steel work to support the new tracks.

Trade Notes

Standard Crane & Hoist Company, Philadelphia, Pa., has been taken over by the American Engineering Company.

The Texas Company, New York, N. Y., has been awarded a renewal of its contract for all rolling stock lubricants with the Brooklyn Rapid Transit Company and the New York Consolidated Railroad for the year 1923.

The National Railway Car Cleaning Company, Jersey City, N. J., has been incorporated at Trenton with $25,000 capital to engage in car cleaning. The papers of incorporation were filed by Butler & Butler.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has leased a six-story building to be erected on a lot 100 ft. x 150 ft. at Jones Avenue and Marietta Street, Atlanta, Ga., at a cost of $360,000. The building, which is to be known as the Westinghouse Electric Building, will be constructed according to the company's specifications and will be used as an office, warehouse and service station. Construction work was started Dec. 1 and will probably be completed by next May.

New Advertising Literature

Irving Iron Works Company, Long Island City, N. Y., has issued Catalog 3A82 which describes the generous lighting afforded in dark places where Irving Subway is used overhead.

The Linde Air Products Company, New York, N. Y., started in August of this year the publication of a monthly entitled *Oxy-Acetylene Tips*. It was announced that the purpose of the booklet was to convey to members of the organization "information which may be used to promote a larger application of the process by existing users, and encourage its employment by present non-users."

Ingersoll-Rand Company, New York, N. Y., and A. S. Cameron Steam Pump Works announce the opening of a branch office at 718 Ellicott Square Building, Buffalo, N. Y. This new office is equipped to render full service to those interested in air, gas and ammonia compressors, vacuum pumps, turbo blowers and compressors, condensers, oil and gas engines, pneumatic tools, rock drills, centrifugal and direct-acting pumps and other of the numerous products manufactured by these companies.

Good Merchandising as Important as Economical Operation

A GOOD MERCHANT, when congestion of purchasers at the counter becomes noticeable, puts on another clerk, and another and another, as needed to handle sales as rapidly as they come. That same merchandising principle applies to the street railway business. If the sale of transportation were properly handled, more cars would be put on a line just as rapidly as the space in them was bought. In other words, the best merchandising would be always to have room for all passengers who presented themselves.

To do this, without running into car miles operated at a loss, requires comprehensive knowledge of the general riding characteristics of a line; coupled with some means of promptly sensing the detail fluctuations in the passenger traffic that take place from day to day. These two aspects of the scheduling of cars are what have been worked out with fine success (as measured by increased net revenue) in Brooklyn, as related in the leading article this week. A traffic check now and then gives the general characteristics of each Brooklyn surface line. The daily graphs showing early this morning the results of yesterday's operation give the information from which to direct more or fewer seats per hour, in order to have on hand when and where wanted all the rides that will be bought, but not any wasteful surplus.

Many railway managements make quite a point of avoiding any unnecessary car mileage, but overlook the importance of the other aspect of always having enough service. The latter is about equally important with the former in making profits. These managements are good at saving but poor at merchandising. They are good economizers but poor spenders—poor "gamblers" on expenditures to increase riding. The experience of Brooklyn has furnished a striking example of how more service will bring more patronage. A blanket increase of 1 per cent or more in number of car miles called for on a timetable for a line has promptly resulted in such an improvement in riding that it was but a comparatively short time until another increase in service seemed warranted from a loading standpoint and desirable from a merchandising standpoint. For example, on the Graham Avenue line, a 2.8 per cent increase in car mileage in August, 1922, as compared to July, 1922, resulted in 1.7 per cent increase in revenue; 1.2 per cent additional increase in service in September over August resulted in 1.6 per cent increase in revenue; 2.1 per cent service increase in October over September brought 2.1 per cent increase in revenue. In another case a 9.2 per cent service increase brought 11 per cent revenue increase; and the following month 4.8 per cent additional increase produced 8 per cent more revenue. Compared with the corresponding month of the previous year this was a 13.7 per cent increase in service and a 19 per cent increase in revenue. These two examples are cited because the increased revenue was traceable directly to the better service, there being no other contributing causes.

This cycle has happened repeatedly in Brooklyn in the last three years and has resulted in several cases in increasing the earnings of a line in the three-year period by 40 or 50 per cent, when it was thought that all the business available was being handled before. Other companies have experienced the same thing. The installation of safety cars on more frequent headway than was operated with larger cars has furnished this same experience in many cities all over the United States. Up to certain limits, the patronage in the street railway business does respond to more service. And often these limits are much higher than was thought before the service increases were made. Of course, this is the way to improve the net earnings. The more passengers at a small profit per passenger, the better the net.

On the other hand, the value of putting the cars where the traffic is, spacing them properly, and avoiding waste mileage is demonstrated by the Brooklyn experience in 1921, when, as compared to the year 1920, the car mileage that was operated was 10 per cent less, but between 7 and 8 per cent more passengers were carried without overcrowding.

What Is Arithmetic Between Friends?

SHOULD estimates be made of the deficit which will result from the establishment of a 5-cent fare on the Seattle Municipal Railway, and if the loss appears to be considerable, should this fact deter the City Council from ordering such a fare? The *Post-Intelligencer* of that city evidently thinks that in these matters mathematics are a pretty poor substitute for politics. In an editorial in its issue of Dec. 4 it says, in part:

> Council proceedings in recent weeks do not give encouragement for the future regarding this 5-cent fare question, which every one but the honorable legislators thought settled at the last election. When it was finally agreed by competent authority that all legal impediments to reducing the rate had been cleared away there seemed no further bar to progress.
>
> Then up bobs one scheme and another, each based on reams of solemn arithmetic concerning the probable financial return of a 5-cent fare plus ordinary transfers or a nickel fare plus transfers at 2 cents or a nickel straight and tokens in quantity at a reduced rate plus the transfer privilege. . . .
>
> The finance and public utilities committees of the Council meet next Thursday morning at 10. It would be a fine move if representatives of the people who wish Seattle to grow and prosper, and its working people given relief from extortion, should gather at the meeting and tell the lawmakers what they think of the Fitzgerald ordinance and the obstructive tactics delaying its adoption.

It must be a satisfaction to the taxpayers of Seattle to realize that some members at least of the Council are thinking of arithmetic. It is one thing for a City Council to order a low fare on a privately owned property, whose stockholders are few and possibly non-residents in considerable part. It is another matter when the resulting deficit has to be paid by the city as a whole. It is no wonder that one Councilman demanded more time to study his estimates of what would happen if the 5-cent fare was adopted and for another to present figures showing "the dire results of reduction in varying amounts."

The recent incident at Seattle illustrates one of the great dangers of municipal ownership and operation of business enterprises. Whatever may be said by the politicians before the undertaking is begun about the profits which will result from municipal direction, it is pretty safe to say that after the enterprise is under way there will be continuous demands for unprofitable extensions and lower fares, and it will take a brave mayor and council to resist these demands.

The newspaper whose opinion has just been quoted follows the practice of printing at the head of its editorial page each day a text suggested by a different local clergyman. The text to guide the readers of the paper on the day in which this editorial appeared will be considered by some to be very appropriate. It was: "Be not deceived: evil communications corrupt good manners." And if the famous apostle who wrote these words were living in the present day the chances are that he would have added that very often they corrupt politics as well.

The Index Furnishes the Key for Much Valuable Information

IN HIS presidential address at the convention of the Union Internationale de Tramways at Brussels last October, M. de Burlet pointed out that the electric railway industry has no trade secrets like most of the manufacturing industries. Each discoverer of a better way of accomplishing a certain result is glad to give the information which he has to all other companies because there is no commercial rivalry for business between them.

This is as true in America as in Europe and it is largely for this reason and for the conditions which grow out of it that the *Electric Railway Journal* has always made a feature of its volume index. The editors realize that many of the problems which come up as new on some railway properties actually have been successfully solved in the past by others and that the method followed has been described in previous issues of this paper. Hence they have made an effort to make each volume index as complete as possible and to include it with the last number of each half year, so that every subscriber will be sure to have his copy of the index as soon as the volume is completed. This makes binding more easy, and a larger number of the subscribers of this paper are finding it is worth while to bind their copies each half year.

The index for this volume contains between 3,000 and 4,000 entries or cross references, and a continuous policy of treatment is assured by the fact that the same indexer has done the work for a number of years. A feature is the list of key words by which the entries to any topic sought can easily be found. The index as printed represents to the publishers probably a higher cost per page than any article which has appeared in the paper, but if it accomplishes its purpose this expense is considered well worth while.

New Norfolk & Western Locomotives Add Notably to Road's Electric Equipment

IN JUSTICE to the Norfolk & Western Railway electrification, as much publicity should be given to the ways in which mechanical defects in the early locomotives were overcome as was given to the existence of those defects. The mechanical parts of the original locomotives were built along steam locomotive lines, utilizing the best information available at the time. However, there was lacking previous experience with electric locomotives in such extremely severe service. The result was a straining of the underframes with consequent bearing and other troubles, and in due course the frames went to the scrap heap, where they have served as a constantly unpleasant reminder of now happily bygone days. Stouter frames replaced the weaker ones, with excellent mechanical results but with an unpleasant effect on maintenance figures while this was taking place. A point that is sometimes overlooked, however, is that the dozen machines kept an enormous tonnage moving right through war time and were rebuilt without detriment to the service. The troubles which were encountered were not due to the electrical system used, but to the unprecedented severity of the traffic.

Four new locomotives have recently been ordered and will soon be under construction. They embody all of the mechanical lessons taught by experience with the first machines, and also the results of experience with recent enormous steam locomotives used in similar service. The side frames will be heavy vanadium steel castings, with steel cross members of corresponding strength. Each half unit will have a rigid wheelbase as long as the curvature of the track will permit; in other words, the articulated joint will be used only between units. The twin-motor drive has also been abandoned in favor of the single-motor drive, with two jackshafts per unit.

A number of interesting electrical changes also have been made in the new design, the most notable being the use of a synchronous rather than an induction phase converter. This puts into the system what was lacking before, a piece of apparatus which permits correction of the motor power factor. Oil-cooled transformers form another improvement.

The new machines have a one-hour rating of 4,000 hp., an enormous concentration of motive power. This is, to be sure, less than that of the experimental single-phase-three-phase locomotive built for the Pennsylvania Railroad six years ago, shown at the Atlantic City convention of the steam railroad associations in 1917 and heralded as the most powerful locomotive ever built. The N. & W. machines will, however, be the most powerful in regular service. The two types of locomotives are comparable in several particulars. The Pennsylvania machine, for example, has a synchronous converter, like the N. & W. It has twin-motor drive through a jackshaft to three driving axles, whereas the new N. & W. machines have single-motor drive to two driving axles. The rigid wheelbase includes these three axles as compared with four drivers on the N. & W. machines. And there are two articulated trucks to the Pennsylvania locomotive, a plan also abandoned on the newer N. & W. locomotive as compared with the earlier one. An illustrated account of the Pennsylvania locomotive appeared in the issue of this paper for June 9, 1917, page 1048. References to articles on the earlier N. & W. locomotives will be found in one on the new machines appearing in this issue.

Fitting Service to Traffic in Brooklyn

How the Data Developed by the Transportation Department of the Brooklyn Surface Lines Are Used to Follow the Trend of Service Requirements and Adjust Schedules Accordingly so That Losses May Be Avoided, but, More Important, so That as Much Service as Will Be Purchased Is Always Available

BY A. L. HODGES
Assistant Treasurer and Assistant Secretary Brooklyn (N. Y.) City Railroad

THE successful building up of revenue and the conservation of its expenditure must be based on a close study of service requirements and the cost of producing them. This study must be a continuous one, for in every cosmopolitan city there is an ever-changing riding habit. This is particularly noticeable in Brooklyn, where the population at the present time is increasing at a very rapid rate as indicated by the new building operations carried on during the calendar year 1922, which, it is said, will considerably exceed $200,000,000. This figure, it is claimed, far exceeds that for any other community.

In order to keep pace with these ever-changing conditions the transportation department must keep its hand on the pulse of the car rider, so to speak. It must gather, compile and analyze its own information as to operating costs and service required. To do this effectively the transportation officials must avail themselves of "up-to-the-minute" information in advance of the formal figures furnished by the accounting department. They must not be forced to wait for figures furnished by other departments, which, as a rule, are fifteen to thirty days behind the actual operation.

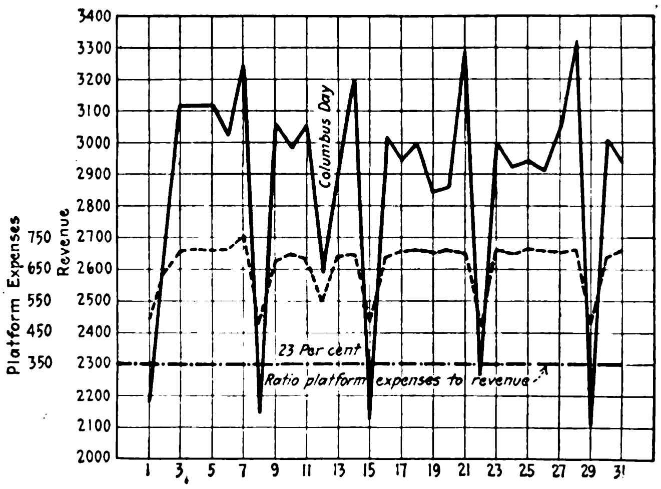
One of the essential phases of electric railway operation is to furnish the proper transportation facilities at the time and place required by the car rider; not only fitting the schedules to the habits of these riders but also providing sufficient service to attract additional business. No one ever tells the transportation department how many people are going to ride on any given line, or the time they intend to use the service. So it is up to the railway to outguess the car riders and always to have ample service to attract the business, not drive it away with overcrowding.

This is not so different from any other industry or business which sells direct to the consumer. The merchant must display his merchandise in sufficient quantities to meet the demand, and when his stock runs low he must replenish it promptly or lose trade and profit. With the railway companies, it is about the same. They must plan not only the transportation they expect to sell each day, but the service must be such as to anticipate the growth of traffic so that new riders may be provided for and new friends made.

Further than this, it must be borne in mind that if the operating schedule is not fitted to the service requirements it develops high operating cost with its resultant waste.

The operation of the Brooklyn surface lines during the past three years has demonstrated to us more than ever what a tremendously important thing the keeping of schedules adjusted to the ever-changing traffic requirement is. To show what the application of these principles will accomplish, one needs but glance at the reports of the Brooklyn surface companies for the fiscal year ended June 30, 1922. Here it is seen that a large deficit for the previous year was turned into a substantial surplus by June 30, this year. In fact, the directors of the Brooklyn City Railroad on Nov. 8, 1922, declared a division of surplus earnings among its stockholders amounting to 20 cents per share, par value $10. At the same time the directors suspended the collection of a second fare on the Flatbush Avenue line, thus sharing the company's prosperity with the car riders by relieving them of this additional charge.

The ability to turn a deficit into a profit is attributable in very large part directly to the close attention given to the development of efficient service on each line, thereby avoiding waste and attracting business to the cars.



MONTHLY GRAPHIC INDEX CHART MADE FOR EACH LINE AND BROUGHT UP TO DATE DAILY. EXPENSES AND REVENUE ARE IN DOLLARS

The platform cost, which is a fairly constant part of the total operating cost, is used in determining the proper ratio between operating costs and gross revenue for the purposes of the transportation department.

If this operating ratio drops below a predetermined point it may mean that insufficient service is being operated and in that case a revision of the schedule is immediately effected, relieving any excessive loading of cars. By a like token, if the operating ratio barometer rises above a predetermined point the service is promptly indicated to be more than the line requires, due perhaps to changes in industrial conditions or seasonal changes. A closer study of the line may reveal that a complete readjustment of the schedule can be made to advantage. Thus, the value of a scheme that immediately calls attention to over or under service is readily seen, the corresponding change in service requirements being then promptly made before any loss accumulates.

The method by which the management keeps its hand on the operating costs of each of the sixty-eight routes comprising the Brooklyn surface lines is predicated on graphically analyzing the conductors' daily revenue turn-ins with respect to the expense of platfrom time and making frequent cross-section checks of the traffic actually handled over each route so as to know where the maximum load point is on each line, as well as the manner or degree in which the traffic builds up or tapers off from this maximum loading point. A check of this kind gives the riding characteristics of the line, by direction, and this having been determined the next step is to rebuild the schedules and fit the car service so that the point on the line at which the maximum number of seats are operated will correspond to the maximum load point, and so that the service furnished will taper off from this point in the same ratio as the passengers carried.

FIG. 4

Fig. 1—Form used at depots for recording conductors' turn-in. Fig. 2—Form used in transportation superintendent's office to record turn-in or receipts by lines. Fig. 3—Form used for recording passengers on cars at each of various points along route. Fig. 4—Form on which data from "passenger count" forms are tabulated by fifteen-minute periods for use in graphing cross-section check.

This idea of a graphical analysis of schedules, riding, costs, etc., is not entirely new, but the application to a large city system had apparently not been tried previous to its introduction here by C. E. Morgan, vice-president and general manager. Since 1920 Mr. Morgan has been in direct charge of all the surface lines in Brooklyn, now being operated as a unified system through arrangements between the Brooklyn City management and Receiver Lindley M. Garrison of the Brooklyn Rapid Transit Company. The Brooklyn Rapid Transit surface lines which Mr. Morgan operates in connection with the Brooklyn City Railroad are the Nassau Electric Railroad, the Brooklyn, Queens County & Suburban Railroad and the Coney Island and Brooklyn Railroad, and these companies, together with the Brooklyn City Railroad, comprise 525 miles of track. During the fiscal year ended June 30, 1922, these companies operated 46,433,818 car-miles, 5,702,141 car-hours and carried 431,700,214 revenue passengers.

With the primary purpose in mind of producing adequate and satisfactory service on a basis that will make a profit, a complete survey of operation is continuously carried on. The object of this undertaking is to ascertain where the patrons are located, their riding habits and the distance they travel. This learned, the next step is to adjust the service to their needs. In doing this some novel methods have been developed and are now being regularly used in addition to those that are in more or less general application throughout the country. Under the general scheme of handling conductors' remittances at the carhouse, a record is kept by lines (Fig. 1), showing the amount of each conductor's turn-in. Inasmuch as the ticket fares under the scheme of fare collection used are counted as cash, the cash turn-in takes into consideration all of the revenue from passengers carried on the line. This record sheet had been developed to give a summary of the day cards for the convenience of the accounting department in checking off the contents of the different bags when taken out of the carhouse safes the following morning.

How Operating Data Are Recorded

The next step is to get the information not only to the transportation department but to the management by 9 o'clock in the morning of the following day. This is being done by having each of the several depot masters telephone this information during the early morning hours to the office of the superintendent of transportation, where the night clerk tabulates it on a special form (Fig. 2.). The depot master, when reporting his route receipts, also reports the corresponding timetable or platform cost for each line, which takes into consideration extra service, overtime on account of delays, etc. It is but a simple matter then for this clerk to foot up the columns, first by depots, then as a whole, add the corresponding depot figures and totals from the duplicate records of a year ago and deliver this tabulation to the operating officials and the management. This tabulation then gives the operating officials access to the two most essential figures with which they are concerned—receipts and platform costs. Actual checking with the final figures for passenger revenue furnished by the accounting department has indicated that these preliminary figures are within 1 per cent of being correct, which is sufficiently accurate for the purposes.

Upon receipt of these forms showing the individual route receipts and platform costs for the previous day in the general manager's office, they are transferred to individual monthly graphic route charts, sample of which is illustrated on page 1001. It takes but a few minutes for a clerk to transfer the figures to these route charts, so that shortly after the opening of the office there is available an actual picture record of the performance for the previous day, together with the platform cost of producing it. At the end of each fifteen-day period the percentage of timetable cost to the passenger receipts is calculated for the period and is likewise shown on the route charts.

As shown on the chart reproduced, this percentage is 23, which indicates the ratio of platform cost to gross receipts for the period and enables the management at a glance to determine whether the line is going ahead or falling back. If the latter is the case the management can then focus its attention on lines needing an adjustment of service. In this case it will be noticed the ratio of 23 per cent obtained during the entire month.

Of course there are certain conditions which are reflected in the charts each day, such as interruptions to headway, etc., which shows the necessity for closer application by the supervisory forces. Any irregularities with respect to fare collection are also readily discernible, indicating when a concentration of the special service force on any route is desirable.

Coincident with the plotting of the platform expense, these costs are scrutinized in comparison with the schedule allowances, to determine their correctness. Thus a check can be made of the operation of any unauthorized service or the failure of any division to operate the schedule as provided.

A recapitulation of a schedule is shown in the form reproduced as Fig. 5. This shows the number of cars, number of trips, platform cost, number of runs, and headway—all of these figures being compared with preceding schedule showing increases or decreases in service proposed. The running time between various time points is also shown, as well as changes in running time during the different hours of operation. The graphic index charts are then compared with these recapitulations as to earnings and cost of operation, and any extraordinary events or any circumstances that could tend to divert traffic are at once noticeable and the reasons therefor can be noted on the chart, which altogether forms a very complete daily log of the operation of each line. A study of these daily index graphs and a comparison with those of the preceding day, month or corresponding month of a previous year will tell whether the traffic over any line is changing and the degree of such change. With personal knowledge and observation of conditions surrounding each line, it is then possible to prepare a fairly accurate prospectus for future guidance.

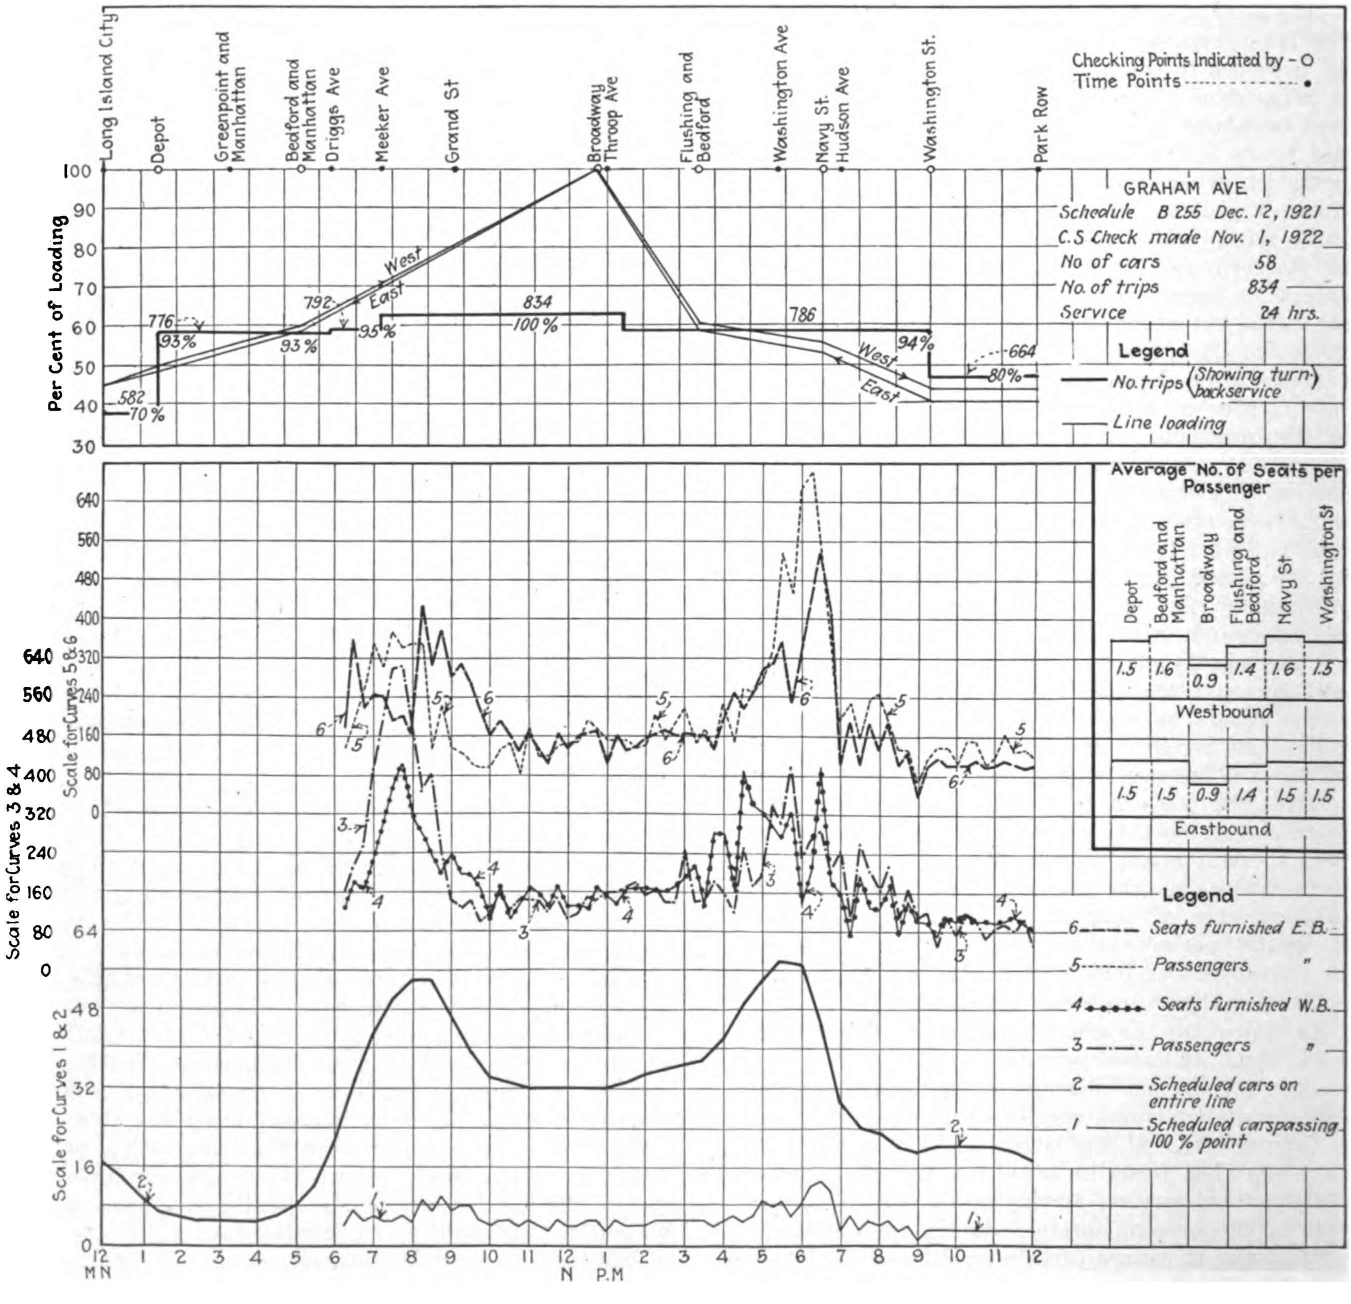
Fig. 5—Recapitulation of a Schedule

Should the study of these graphic charts indicate that the schedule does not fill the requirements of efficient or economical operation, a study of traffic conditions on that particular line is undertaken by making an actual check out on the line. A squad of experienced passenger traffic checkers is maintained for this purpose. These men work under the supervision of the timetable department. While they are available for special checks, they ordinarily operate on a fixed schedule so that an observation check of each line is furnished the transportation department every eighth day. This check will develop any sudden change in the riding habits along a certain route and is also one of the factors in determining the necessity for a closer check and a schedule revision.

When any one of these preliminary reports, graphic charts or service checks develops a condition requiring adjustment of schedule the next step is a cross-section check, so to speak, of the line. The schedule running time of the line under observation is divided into approximately five-minute periods from the initial point to the destination, and a traffic checker, trained in this work, is stationed on the street at each of these points to note the actual number of passengers on the cars passing in each direction. These data are entered on the form shown in Fig. 3. For this purpose the regular passenger traffic checkers are used. They work in shifts covering the entire day's operation.

These checks serve as a basis for the determination of whether or not the schedules fit the traffic over the line. All the information collected by each checker is first tabulated by fifteen-minute periods on a special passenger record form shown in Fig. 4. This form in addition to the total number of passengers on the car indicates the number of seats furnished, the number of cars called for by the schedule, the actual number of cars operated on the line as well as calculated figures showing the average number of passengers per car at the checking point. The different items are then totaled for the checking period to determine the maximum loading point on the line as well as the falling off in number of passengers to be handled at the various other checking points. These figures are subsequently tabulated by checking points to determine the relationship that exists between each of these points and the maximum loading point. This relationship is plotted on a curve to indicate how the traffic builds up to the 100 per cent load point. Corresponding to this traffic curve, the number of trips furnished by the timetable in effect when the check was made is shown on the same graphic chart. This trip curve shows the points between which short-line service has been established, the number of trips furnished between cut-back points in percentage



MANNER OF GRAPHING CROSS-SECTION CHECK OF A LINE TOGETHER WITH OTHER DATA FOR PURPOSES OF STUDYING THE FITTING OF SERVICE TO TRAFFIC. THE CHECK PICTURED HERE SHOWED LOADING THAT NEEDED CORRECTION of the maximum service on the line, and the amount of service between such short line points. The next step is graphically to survey and analyze the operation of the schedule for each hour of the day, divided into fifteen-minute periods, at the maximum point.

HOW THE TRAFFIC CHECK IS GRAPHED

Thus the actual number of cars passing this point in the direction of heaviest riding for the entire period of the check is plotted as indicated by Curve 1 in the large charts on this and the opposite page. This curve shows whether or not the operating department is moving the cars as scheduled at this point.

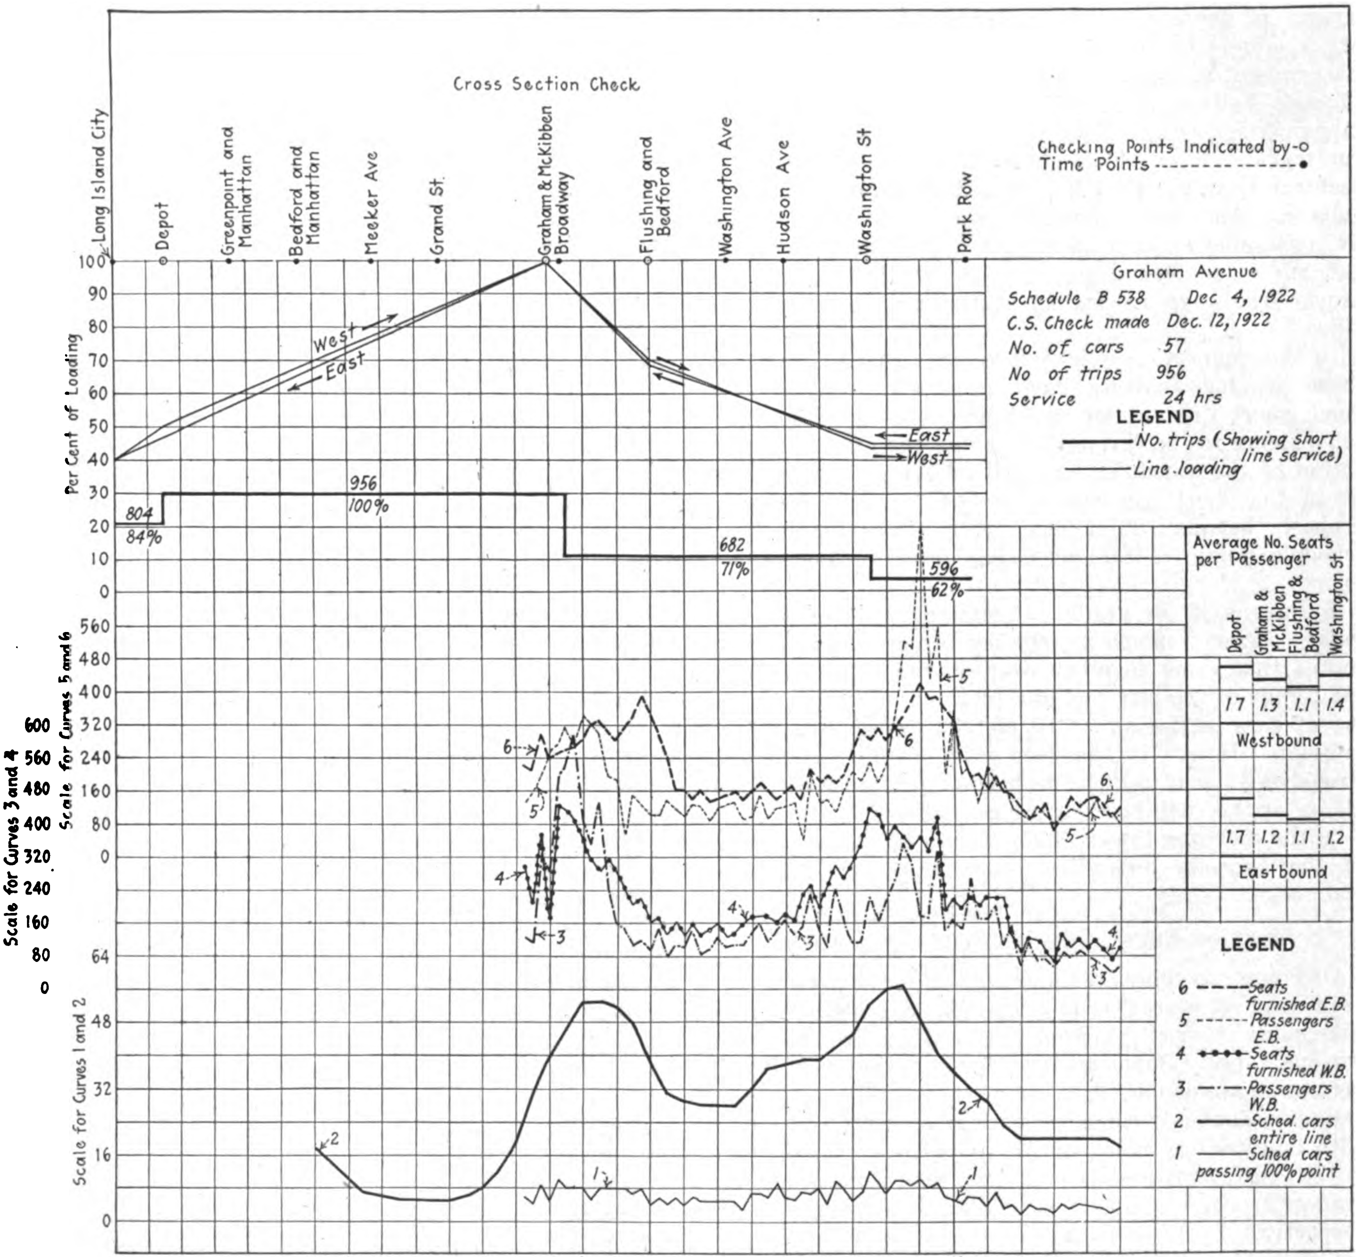
Above this curve is plotted the actual number of cars on the entire line at each hour of the day; that is, the number called for by the schedule in effect at the time the check is made. This is plotted in thirty-minute periods and is shown as Curve 2.

Following this the actual number of passengers carried in each direction past the maximum point is shown graphically by fifteen-minute periods, and this is compared with the adequacy of the schedule in terms of seats furnished. The results of these studies are shown in Curves 3 and 4, respectively, for one direction, and similar information is shown in Curves 5 and 6, respectively, for the opposite direction.

There is also shown on these charts a graphic study of the average number of seats per passenger furnished past the various checking points during the period of the check.

After the preparation of the chart, the data are then ready for the attention of the management. Careful consideration is given to how the service furnished fits the particular needs of the line in question. Such a study may show the need of an entirely new schedule so as to place more service at this or that point to take care of short riders, or it may indicate that closer observation and application by the supervisory force are necessary.

The two charts that are reproduced herewith are both



GRAPH OF CROSS-SECTION CHECK MADE TO DETERMINE WHAT HAD BEEN ACCOMPLISHED BY NEW SCHEDULE PUT IN AS RESULT OF STUDY OF GRAPH ON OPPOSITE PAGE for the same line, the one on page 1004 showing that considerable alteration of schedules was necessary to fit properly the service to the traffic requirements. The second chart was drawn from data obtained by a check made to show the results accomplished after introduction of a new schedule. Analysis of this chart (page 1005) shows considerable improvement in placing the service to meet more nearly the traffic demands. The chart shows the results obtaining after a week's operation of the new schedule and indicates that the new schedule has not altogether met requirements and that further adjustment of the service is necessary.

Our schedule department compiles on an average of 300 timetables a year and it usually requires about fifteen days from the time the cross-section check is made to place a new schedule in effect. In cases of extreme emergency, however, a new schedule can be arranged on a temporary basis in a few hours by "patching" the existing timetable.

Graphic studies are always made of new schedules before they are placed in operation. This really means laying out the schedule in picture form for the entire period of operation, in most cases twenty-four hours. A sample of such a graphic timetable was reproduced in *Electric Railway Journal* for Sept. 24, 1921, page 499, in connection with an earlier article on some phases of our traffic studies. This chart shows the movement of each car from the time it pulls out of the depot until it pulls in. Any non-productive time allowances are readily noticeable as well as any errors in the scheduling and one is enabled quickly to see whether or not the proper headways or spacing of the cars has been provided.

In this connection it is well to state that in Brooklyn these graphic analyses have developed the fact that much short line service could be operated without inconvenience to the through rider and the graphic preparation of the schedules has enabled the management to fit in the short line service so as to space the cars properly between all points. It has also insured the schedule going to the operating force in the proper form.

By means of the graphic timetable it is also possible to lay out for even spacing the headways of two or more routes that come together over a trunk line reaching the center of the city and eliminate unnecessary bunching of cars in the congested districts as well as on the individual lines. It has been said of the Borough of Brooklyn that it is "the bedroom of Manhattan." A glance at the rush-hour riding as pictured in the charts —in the morning toward New York and in the evening in the opposite direction—shows the basis for this statement.

TYPE OF EQUIPMENT MUST BE CONSIDERED

Of course in figuring these schedules the type of car used must of necessity be given considerable attention. Like many other cities, Brooklyn has its share of cars of various types. Some are standard single-truck safety cars, some are double-truck one-man, others are one-man, two-man, double-truck, some with cross seats and others with longitudinal seats, and besides these classes there is the center-entrance type of car, with center-entrance trailers. For rush-hour scheduling, car capacity, irrespective of type, is figured on the basis of one standee for each 1½ sq.ft. of floor space in the aisles, except on the longitudinal-seat cars, where 9 in. of knee room is deducted for the seated passengers. A seat width of 17 in. per passenger is the basis used in calculating the seating capacity of cars with longitudinal seats.

In addition to the daily graphic records of receipts and platform cost, a monthly tabulation is maintained showing by routes the total monthly receipts, platform cost, passengers carried, mileage operated and receipts per car-mile. Comparisons are also carried in separate columns with the month of the previous year. These figures are not those furnished by the accounting department, but are predicated on the monthly totals of the figures worked up each day by the transportation department. By this means the transportation department and the management can have available within a very few days after the close of the month nearly accurate statistics showing what the transportation department has actually accomplished in the way of handling traffic, with the cost thereof. This gives a monthly check on the conditions surrounding the operation of each line over a period of several years and any fluctuation in earnings or the cost of securing such earnings is readily discernible.

When the figures are received from the accounting department, showing the actual receipts and total operating costs for each line, the cost figure is proportioned among the various lines, on a mileage basis, taking into consideration the various types of units run, whether single-truck, one-man, two-man, double-truck cars or double-truck, one-man cars, etc. This gives a revised unit figure for use in estimating expenses in advance of actual figures. Naturally the ratio of expenses between these types of cars varies on different properties and each management must prepare its own ratios as to the car-mile cost of each unit used.

This unit cost or yard stick having been determined for each type of equipment in use on the individual line, then the actual operating expenses for each line may be ascertained by multiplying the mileage operated by each type of equipment used on the line by this unit cost, which gives a fairly accurate allocation of the operating expense to the respective lines. This enables the management readily to ascertain which of the lines operated are adding red or black to the balance sheet, and should a line not meet its operating expenses, action can be taken immediately to secure the desired results without permitting any unnecessary accumulation of loss.

The complicated duties of the transportation department of any railway, large or small, makes any effort to simplify this labor quite worth while. The procedure followed in Brooklyn and the results obtained therefrom have been pointed out for whatever help they may be to other properties in getting more effective use of the cars.

The management of the Brooklyn street car systems is likewise guided by similar data and charts which are used in checking other departments of the organization, particularly the maintenance departments. These are not only of great value in connection with formulating the budget requirements, but also assist in securing more efficient operation with reduction of costs.

According to a statement issued by the United States Department of Commerce, the Midi Railroad in France is making rapid progress with its electrification work. It was expected that the Pau-Tarbes line would be completely electrified by Jan. 1, 1923, that the system will be extended to Montrejeau by March, and that during the summer of 1923 the Dax-Toulouse line will be electrified.

Moving a 740-Foot Steel Bridge

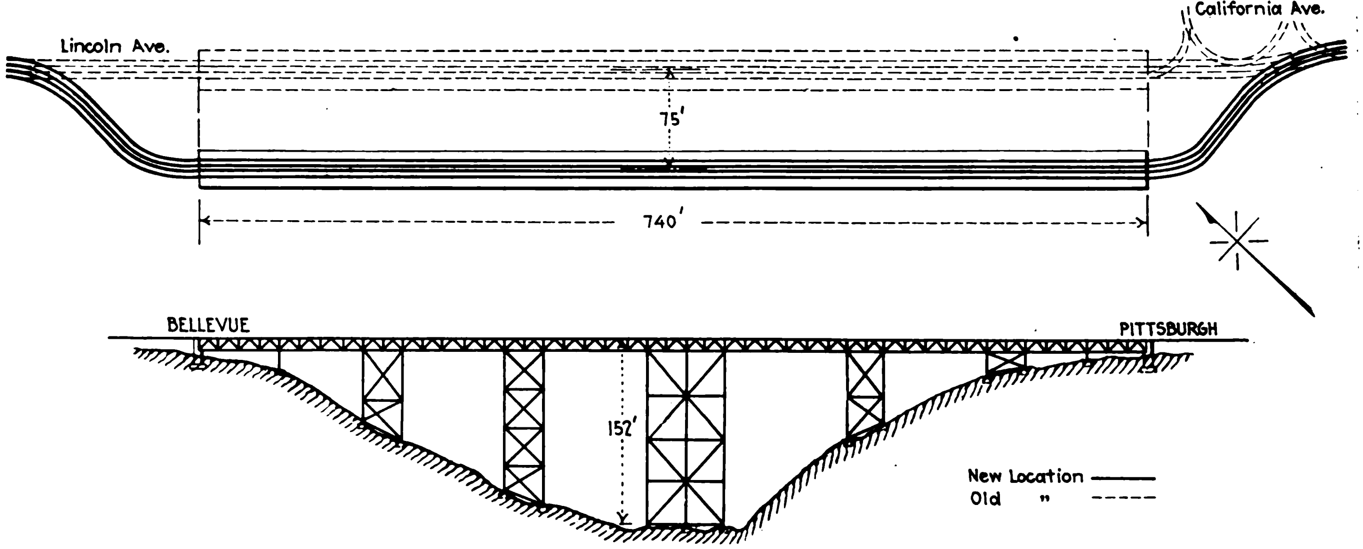
This Structure, Weighing 1,000 Tons and Reaching a Maximum Height of 152 Feet, Was Moved 75 Feet Down Stream by the Pittsburgh Railways in Order that Continuous Service Might Be Provided During the Construction of a New Concrete Highway and Railway Bridge

MANY people have gazed in wonder at the spectacle of a building being moved around the block, sometimes with the home life or business going on as usual in transit. It is not an unusual occurrence for a small bridge to be shifted in position, and occasionally a story appears of the moving of large structures. The moving of the Jack's Run Bridge at Pittsburgh proved to be a matter of considerable public interest locally as well as one of engineering importance.

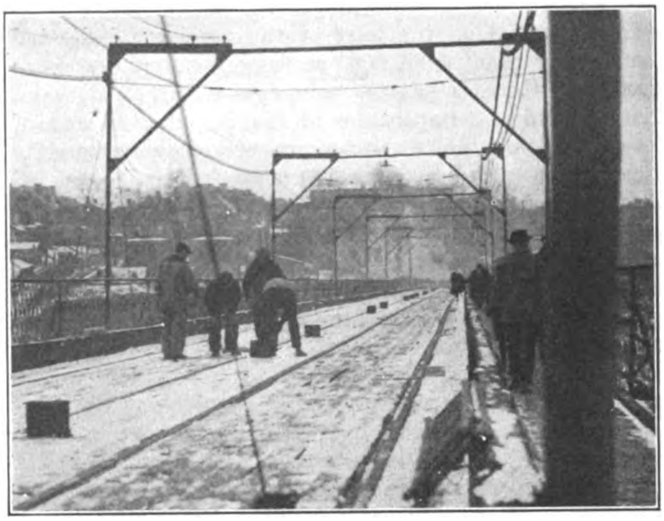
This bridge is a steel viaduct 740 ft. long and has a maximum height of 152 ft. above Jack's Run, a stream at the bottom of a ravine which forms the line between the city of Pittsburgh and Bellevue Borough. The steel structure comprises fourteen spans, varying from 30 to 96 ft. in length, of Warren type trusses 8 ft. deep with two lines of intermediate stringers and supported on masonry pedestals and with masonry abutments at each end. The deck carries a two-track roadway for vehicular traffic with a double line of street car tracks and two sidewalks.

The Jack's Run bridge was erected in 1893 by the Schultz Bridge & Iron Company of Pittsburgh, for the Jack's Run Bridge Company, a corporation whose stock at that time was owned by the same interests that controlled the Federal Street & Pleasant Valley Passenger Railway. This road operated from Pittsburgh into the boroughs of Bellevue and Avalon and later to Ben Avon and Emsworth and furnished the original electric car service to those communities.

The bridge connected California Avenue, Pittsburgh, with Lincoln Avenue, Bellevue, over the ravine mentioned and at the time of its construction was considered the largest steel structure then in use for electric railway purposes. It was also used by all classes of vehicular traffic and foot passengers. Tolls were collected until it was taken over by the County of Allegheny in 1917 and then made free to all traffic except electric cars.



OLD AND NEW LOCATIONS OF JACK'S RUN BRIDGE



DURING THE MOVING CAR SERVICE WAS INTERRUPTED, BUT PASSENGERS WALKED ACROSS TO TRANSFER FROM ONE LINE TO THE OTHER

The principal through local highway route, as well as the Lincoln Highway, leading west from Pittsburgh, crosses this bridge. This, together with the largely increased population of the suburban districts to the west, had resulted in a volume of vehicular traffic entirely too heavy for the capacity and strength of the structure.

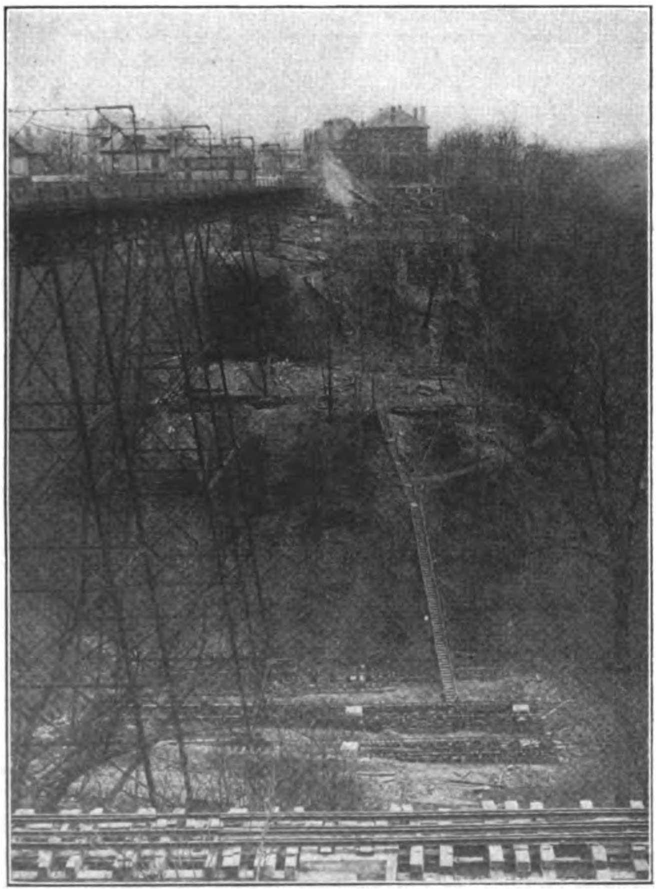
It was therefore considered necessary either to make extensive repairs to the old bridge to strengthen it or entirely to replace it by a new structure. As the bridge is now owned by Allegheny County, the county commissioners decided to replace the bridge by a reinforced concrete arch viaduct having a width of 60 ft. To do this required the immediate dismantling of the old bridge, and the receivers of the Pittsburgh Railways Company were requested to cease operation of cars over the bridge on or before Dec. 1. They were also informed that it would be at least a year before traffic could be resumed using the new bridge.

The commissioners proposed to erect over the ravine a foot-bridge for temporary use by persons desiring communication between the districts at each end of the bridge. They also proposed that electric railway passengers be carried to each end of this structure and there transfer on foot across the ravine by the foot-bridge and that through car service be provided by use of an alternative car line passing West View Park over a route several miles longer.

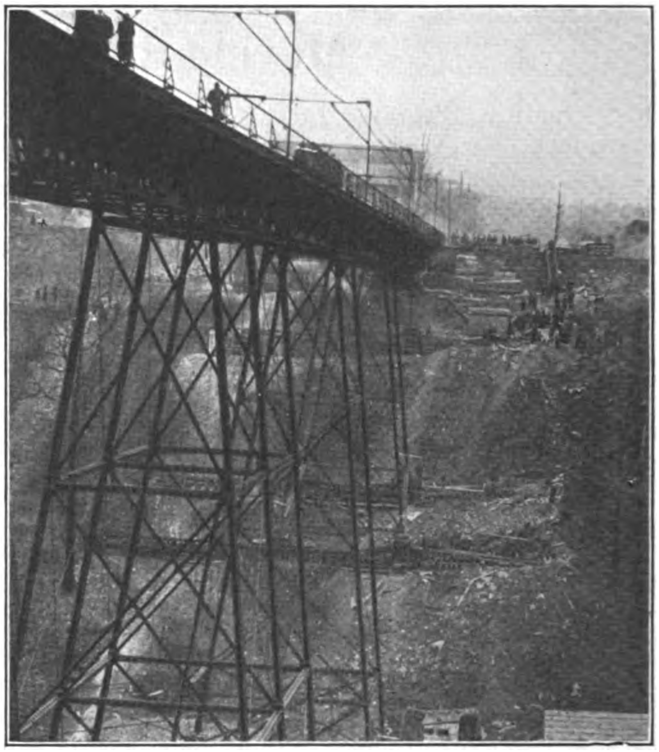
Investigation on the part of the receivers indicated that more than 4,000,000 passengers annually were carried on the cars passing over Jack's Run Bridge and that it would be impossible to furnish at each end of the bridge terminal facilities properly to accommodate them. It would also be most unsatisfactory to ask all passengers to walk across a temporary foot-bridge for at least twelve months extending over two winter periods. The alternative West View route requires from twenty to thirty minutes longer between Pittsburgh and the Bellevue district and it was deemed to be impracticable.

Consideration was then given to the possibility of moving the bridge down stream a sufficient distance to permit the construction of the new bridge without interference. Estimates secured from contractors as to the cost of certain reinforcements to the old bridge and for moving it laterally to a temporary location indicated the feasibility of this plan and at a not unreasonable cost.

A contract was made by the receivers of the Pittsburgh Railways Company with the county commissioners whereby the former undertook the work and assumed the cost, toward which the commissioners paid an amount estimated to be about the cost of the temporary foot-bridge originally proposed by them.



THIS VIEW LOOKING TOWARD THE PITTSBURGH SIDE WAS TAKEN ON NOV. 21 AND SHOWS THE HIGHEST TOWER, NEW TIMBER ABUTMENTS, PEDESTALS, RUNWAYS, ETC.



THIS VIEW LOOKING TOWARD THE BELLEVUE SIDE WAS TAKEN AT NOON ON NOV. 25 AFTER THE BRIDGE HAD BEEN MOVED ABOUT 35 FT. THE OLD ABUTMENTS AND CERTAIN RUNWAYS AND JACK SETTINGS ARE CLEARLY SEEN

It was decided to move the bridge 75 ft. down stream to a parallel location and then to dismantle it after the completion of the new arched viaduct. The engineers decided to construct concrete pier supports for the temporary position and timber crib abutments at each end with double timber bents as supports for the ends of end trusses. The timber cribs were of No. 2 crossties, laced together, well doweled and filled with slag and stone.

The work of placing the runways and foundations was commenced on Oct. 25. During this work various reinforcements were placed in the floor system, and tower members and new tracks and overhead lines were constructed from the original tracks on California Avenue and on Lincoln Avenue at each end, over the new approaches to the timber abutments.

Crossovers were placed on the main tracks on the streets at each end of the bridge, whereby cars would transfer passengers during the moving of the structure. Platforms were erected in such position that foot passengers could continuously traverse the bridge sidewalks during the progress of the bridge to its new location.

Steel beams were clamped to the capstones at the base of each pair of columns and rested on 4-in. steel rollers. Under these were steel runways in pairs—one on each side of the column bases. It was decided that the use of jacks would insure a more uniform movement of each part of the bridge than could be secured by the use of cables and hoisting engines, and accordingly single screwjacks were placed at the back of each pair of columns.

Street traffic was discontinued and actual moving was begun at 7:30 a.m. on Nov. 25 and completed at 10 p.m. the same day. Special attention was given to moving all parts of the bridge laterally at a uniform rate. The operators of the jacks each gave five turns to their jacks on whistle signals from a hoisting engine. The engineers had sights fixed on the floor over each pair of towers and line stakes at the bases of the columns by means of which constant observations were taken and any variations were distinguishable and corrected.

The runways proved so level and accurately set and blocked that not all the jacks were necessary and at times twelve men were moving the entire structure, comprising a weight of more than 1,000 tons.

On completion of the movement at 10 p.m., the column bases were locked up on the pedestals, and electric car traffic was resumed on the morning of Nov 26. Inspection of the trusses and their supports on the columns showed that the movement had been so uniform as not to crack the paint nor disturb the dust on the steel work at truss ends at any points.

The Bell Telephone Company had several hundred pair of wires in five cables carried in steel conduits underneath the bridge floor and connecting at each end to terra-cotta conduits. These cables were cut into at each end and sufficient loop cable added to cover the distance the bridge was to be moved. As the movement of the bridge progressed the extra loop cable straightened out and uninterrupted service was maintained.

The new bridge will have a total length of 770 ft. and a width of 60 ft., including a 38-ft. roadway. There will be one 320-ft. two-ribbed arch span over the ravine with six 20-ft. spans at each end, a 120-ft. abutment at the Pittsburgh end and a 60-ft. abutment at the railway end. The construction will be reinforced concrete arches.

The work of moving the steel bridge was planned and carried out under the direction of W. C. Boyd, chief engineer for the receivers of the Pittsburgh Railways, and J. C. Godfrey, of R. W. Hunt & Company, and J. K. Martin of Bellevue as consulting engineers and V. R. Covell, county engineer. The contractors were F. Wilsman, Sr., on the masonry and John Eichleay, Jr., Company of Pittsburgh on the moving of the structure.

The County of Allegheny will contract for the new bridge, proposals for which will be advertised within a few weeks. The plans are being prepared and the construction will be supervised by N. S. Sprague, consulting engineer, Pittsburgh, Pa.

New York Railways Tries Turnstile Car

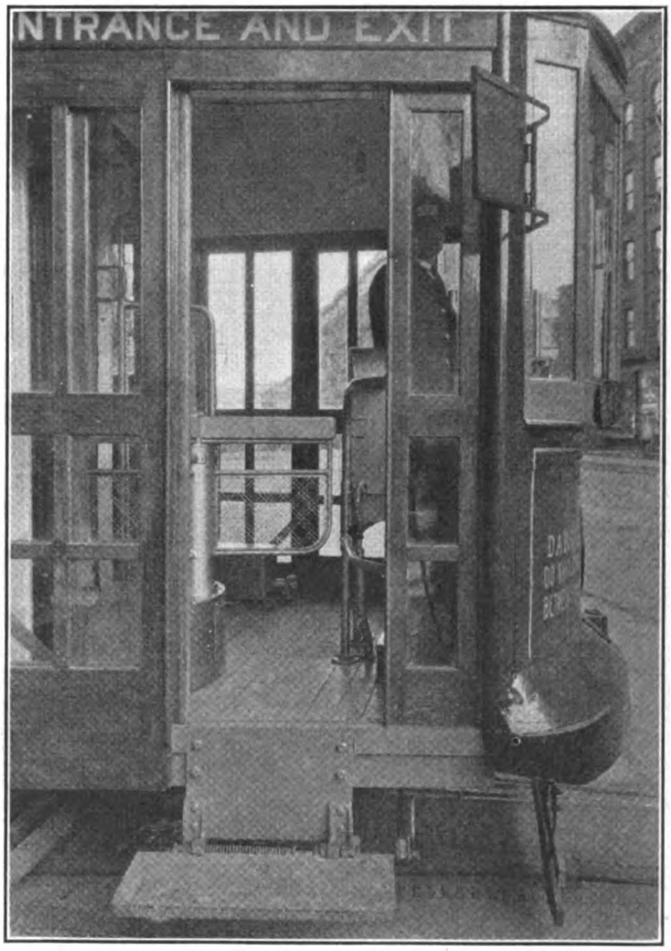
New One-Man Pay-as-You-Leave Turnstile Car Placed in Service by New York Railways Designed to Load and Unload Passengers at Both Ends—Has Provision for Limiting Number of Passengers at One Time

A NEW type of one-man pay-as-you-leave turnstile car has been developed by the engineers of the New York Railways and was placed in service on its Lexington Avenue line Dec. 18. The car used is one of the company's standard closed cars, 42 ft. long, 7 ft. 4½ in. wide and having a seating capacity of thirty-eight inside the car body. The car, before its last remodeling, was a converted pay-as-you-enter car. The platforms are 6 ft. 6½ in. long and originally had double folding doors. In the remodeling the length of the platform was not changed, but the door openings, steps and method of operation were changed to meet the new conditions.

The noteworthy feature of the equipment which is now being tried is in the use of a turnstile at either end of the car, so arranged that it can slide from one opening to the other on the same platform to provide for double-end operation. Through the use of the pay-as-you-leave turnstile, similar in design to those used in the New York subway, both ends of the car are used for loading and unloading passengers and for collecting fares. These turnstiles are of a double-acting type, which permit entrance to the car without obstruction, but which require the placing of a 5-cent piece in the slot of the coin box in order to unlock the turnstile for exit. The turnstiles have four arms, which are wooden at the top with screened pipe barriers underneath.

FEATURES OF NEW EQUIPMENT INSTALLED

An accompanying drawing shows the platform layout and location of the equipment used. As originally designed these cars had sliding doors at the bulkhead. These consist of two doors sliding into pockets on either side, with the opening in the center. These doors have been left as originally used, but only one-half is used



SLIDING DOORS AND FOLDING STEPS PROVIDE FOR ENTRANCE AND EXIT

Door reversing safety shoe

[illegible] ARRANGEMENT OF [illegible]

at a time, the other half closing up to a screened railing, which directs the passengers through the turnstile as desired. The position of the turnstile at each end is at the side of the door opening being used and the passengers after passing through the turnstile enter the car or leave, as the case may be, through the bulkhead doors at the opposite side of the car. When the direction of operation is changed and it is desired to use the doors at the other side of the platform the turnstile is unlocked from its position by the raising of a lever and it can then be pushed to the other side, its movement being guided by two depressed tracks. It is locked in position as desired. The screen which extends from the center of the bulkhead door opening to the inside end of the turnstile arm rotates about a stanchion on the center line of the car at the bulkhead. This railing and screen are changed to the required position by lifting the stanchion at the end of the turnstile and replacing it in another socket.

The folding doors which were originally on the car have been replaced by sliding doors and the openings are closed off to give space for the entrance and exit of but one passenger at a time. The opening door slides on the inside toward the bulkhead. When operated by one man the door and step at the operator's right are hand operated, the rear door on the same side being electro-pneumatically operated. The door which has the door engine operation is provided with a safety shoe for reversing the door in case it should strike an obstruction. Its operation is controlled through a push button at the right of the operator. The door engines used are of a standard type made by the National Pneumatic Company and are installed on the platform floor next to the bulkhead. In order that the operator can see conditions at the rear of the car, a mirror is located on the right-hand front side, and he views the steps of the rear door through this mirror. Another mirror is located immediately in front of him and just above his head so that he can watch conditions inside the car without turning around.

The coin box, which releases the turnstile for exit of passengers, is located on the center line of the car just to the right of the motorman and railings extend from the front edge of this fare box to the door openings on either side of the platform. These serve to guide the passengers and also to prevent interference with the operator. In order to assist in making change a high-speed change-making machine is used, which is installed at the operator's left hand. The fare box is locked, but the operator can gain access to the money for change by unlocking the fare box and removing the coins as desired.

The fare boxes are provided with coin detectors which magnify the coins through a lens, after they have been deposited, so that they can be viewed and seen distinctly through half the length of the car. This is a safety measure intended to prevent the use of slugs to operate the turnstile.

WHEN THE CAPACITY OF THE CAR HAS BEEN REACHED A "CAR FULL" SIGN IS ILLUMINATED ON THE DASH. THE PICTURE SHOWS HOW PATRONS WERE ADVISED OF THE NEW PAYMENT SYSTEM IN AN INESCAPABLE MANNER

A FREE PASSAGE IS ASSURED FOR THE EXIT OF PASSENGERS

Whenever a transfer is tendered for fare, the operator pushes either a hand button or foot button which rings a gong and registers the transfer on a transfer register installed inside the car body over the bulkhead opening. The pushing of the transfer button also operates a transfer relay and this relay remains in its raised position until the turnstile has been operated to allow the passenger to leave the car. It then drops and is in position so that the operator can record another transfer if desired.

Another interesting feature of this equipment lies in the provision made for limiting the total number of passengers on the car at one time. This is accomplished through a totalizing mechanism which is operated through the two turnstiles. The arms of this totalizing equipment move in one direction for each entering passenger and in the opposite direction as passengers leave, so that the combined number of passengers on the car at a given time is shown by the totalizer. When the capacity of the car has been reached a "Car Full" sign on each dasher is illuminated and the turnstiles are locked so that no more passengers can enter the car. Furthermore, the electro-pneumatic door-operating equipment is so designed that the motorman cannot open the door to receive additional passengers and thus to overload the car. The depositing of a fare in the fare box or the ringing up of a transfer, however, releases the turnstile and provides for opening the door.

An emergency cord runs throughout the length of the car and has drops on each platform to provide for cutting off power and the emergency application of the brakes by passengers in case this is necessary. This equipment is the same as has been used on the pay-as-you-enter cars in New York for several years.

For the convenience of the operator in announcing stops and so that his voice may readily reach the rear platform, a speaking tube is provided so that he can talk into this and the sound will be readily heard at the rear.

Rather extended precautions have been taken to advise the traveling public as to the operation of this car and the method of entrance and exit. The exterior of the car is decorated with several large signs to explain that both ends can be used for entrance and that the fare is paid on leaving. Inside the car at the center is a sign which reads: "Passengers Are Requested to Deposit Fare in Slot When Leaving Car. Change Can Be Obtained from Motorman. Present Transfers to Motorman." At either end of the car, just inside the bulkhead, is a sign which reads: "Exit and Entrance at Both Ends of Car."

Officials of the railway have found that a considerable portion of the present car-operating schedule time is consumed in the loading and unloading of passengers, and it is expected that through the use of both ends of the car for both entrance and exit the time at stops can be materially reduced. The provision also for limiting the maximum number of passengers on the car at one time should provide for efficient and comfortable traveling.

Lubrication Requirements for Railway Gears and Pinions

IN A RECENT summary of the lubrication requirements of electric railway gears and pinions the Texas Company* gives the prime requisites of such a lubricant as:

1. It should not harden nor contain any residual matter that is of a non-lubricating character.
2. It should possess marked adhesive properties in order not to drip or flow excessively under abnormal temperature rise nor be thrown off by the action of centrifugal force, or rubbed off under operation.
3. It should be of sufficient body to withstand the excessively high pressure at the point of contact of the teeth, and thereby prevent actual metal to metal friction occurring, whatever the season of the year.
4. It should be entirely free from acids or alkalis which would have a tendency to cause a certain amount of pitting on the highly polished metallic surfaces.
5. It should not be abnormally affected by heat or reacted upon by water, acid or alkali.
6. It should not tend to hold in suspension dirt and particles of worn metal, to produce an abrasive effect.

Other factors that should be considered in making this selection of the lubricant are: Ease of application; the amount required for the initial lubrication and for subsequent applications and the length of time it will efficiently lubricate without renewal.

A lubricant that will meet all of the foregoing requirements will without a doubt increase the life of gearing to a considerable extent and reduce the labor charges and other costs incidental to the maintenance of this type of equipment.

It is very important to have the viscosity of the lubricant approximately the same throughout the year. To meet this requirement with widely differing temperatures it may be necessary to use special grades of lubricants in accordance with the season and the temperature of operation.

---

*An extended article on this subject is published in the November issue of *Lubrication*.

4,000-Hp. Electric Locomotives for N. & W.

Four Double-Unit Locomotives Are Under Construction for the Norfolk & Western Railway's Elkhorn Grade and Electrified Extension — They Will Supplement Twelve Lighter Machines Commissioned in 1915

A BRIEF note in the issue of this paper for Oct. 28, 1922, page 732, directed attention to an order placed by the Norfolk & Western Railway with the Westinghouse Electric & Manufacturing Company and the American Locomotive Company for four double-unit electric locomotives to supplement the present equipment of twelve placed in service in 1915. The designs were prepared by the firm of Gibbs & Hill, consulting engineers, in collaboration with the engineers of the railway company. These machines will have a total weight of approximately 400 tons, the weight on drivers being about 71,000 lb. per axle. They will have about 30 per cent more capacity than the earlier locomotives; that is, 3,300 hp. continuous rating, or 4,000 hp. for one hour. They will be operable at 14 m.p.h. and 28 m.p.h., with a continuous tractive effort at the lower speed of 90,000 lb. With full line voltage and frequency, normal transformer connections and eight-pole motor connections, the one-hour rating will be 108,000 lb., the starting tractive effort for five minutes 168,000 lb. and the momentary starting tractive effort with the four-pole motor connection with 85 to 95 per cent trolley voltage 110,000 lb.

HANDLE FREIGHT TRAFFIC SATISFACTORILY

The twelve present Norfolk & Western electrics, in their nearly eight years of service, have shown their ability to handle satisfactorily an enormous freight traffic averaging 75,000 tons in twenty-four hours, which would have required thirty or more Mallet steam locomotives. The earlier machines and the other details of the electrification were covered at length in articles in this paper for March 20, 1915, page 581; June 5, 1915, page 1058; April 1, 1916, page 644; and Aug. 24, 1918, page 322.*

The new locomotives are for supplementary service to provide for the additional locomotive mileage which will be operated when the extension of the electric zone to Wilcoe and Farm and beyond to the westward are opened up.

Each complete locomotive will contain four 1,000-hp. motors of the three-phase induction type with wound rotors placed directly above a jackshaft to which they will be geared at a ratio of 21 to 100. The earlier machines, it will be remembered, had twin motors, geared to the same jackshaft. The driving wheels, of which there will be eight per half unit, will be 62 in. in diameter.

Each unit is of the Mikado 2-8-2 wheel arrangement, with 16½-ft. rigid wheelbase. Sufficient side swing is provided in the guiding trucks to permit operation around 20-deg. curves.

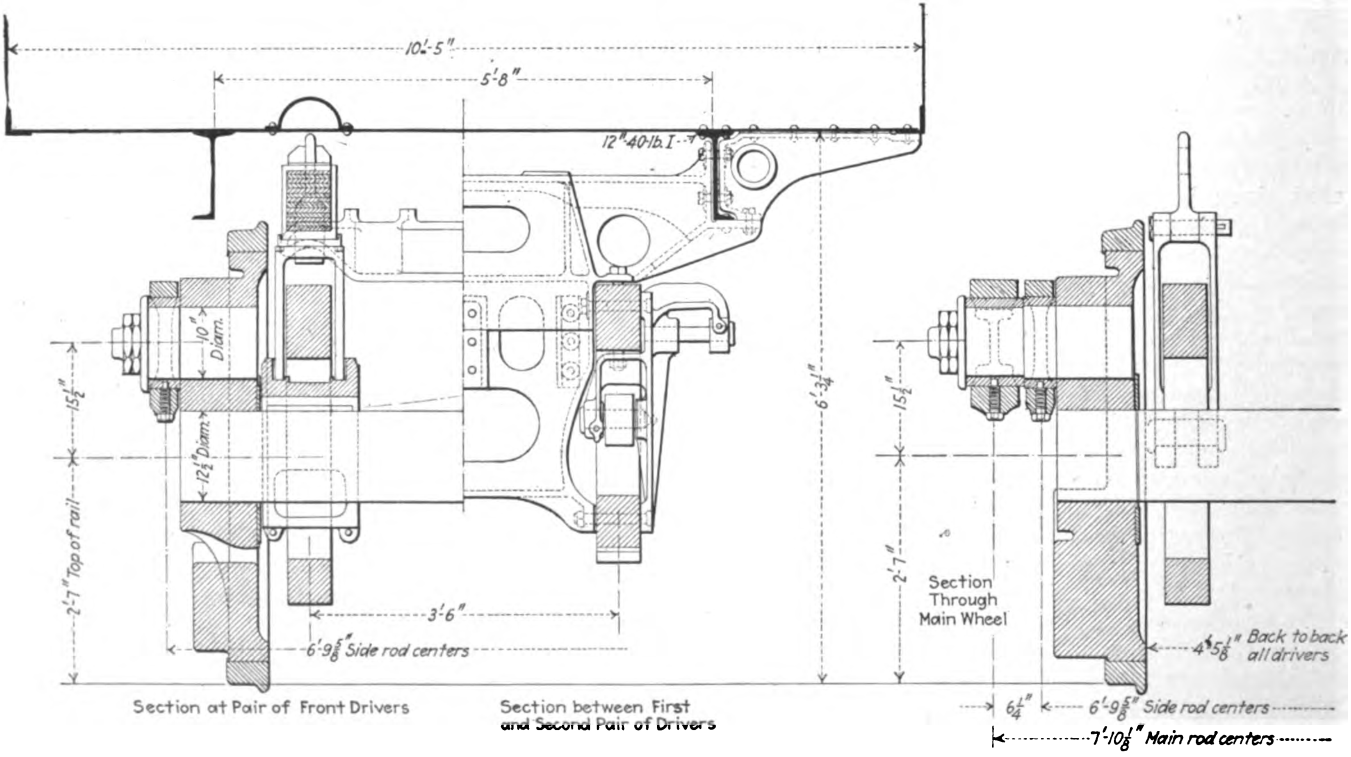
Power will be taken from the line at 25 cycles and 11,000 volts, through a pantograph and oil circuit breakers, to the main transformer, where it will be stepped down to a voltage suitable for the main motors.

A phase converter of the synchronous type will be used to transform the single-phase power from the line to two-phase power. The synchronous type, which was used on the large freight locomotive built for experimental purposes for the Pennsylvania Railroad, is used rather than the induction type, as on the present Norfolk & Western locomotives, in order to give better control of power factor.

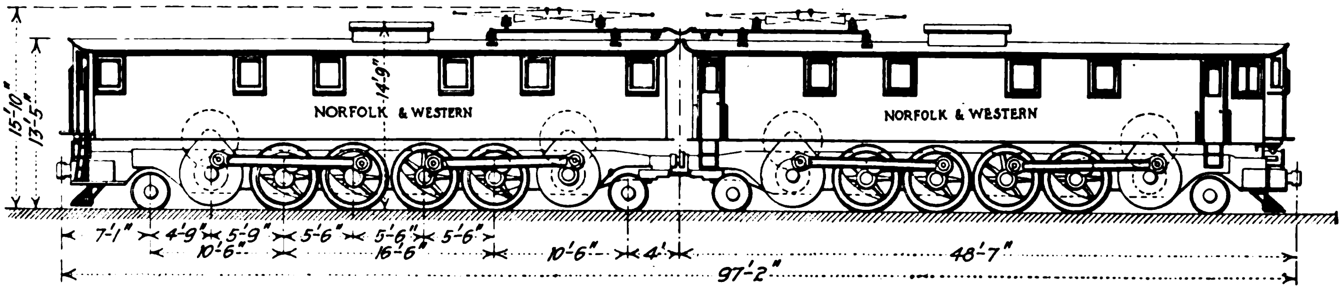
As in the present locomotives, the three-phase main

---

*See also the issues for June 5, 1915, page 1057; Feb. 12, 1916, page 311; March 16, 1919, page 522; and June 12, 1920, page 1202.



SECTIONS OF THE LOCOMOTIVE UNDERFRAME TAKEN AT TYPICAL



THE NEW N. & W. LOCOMOTIVES WILL COMPRISE FOUR MOTORS, EACH DRIVING TWO AXLES THROUGH A JACKSHAFT

motors will be connected to the main transformer and phase converter by the two-phase-three-phase system of connection.

A liquid rheostat connected to the rotors of the main motors will provide for accelerating the locomotive to 14 and 28 m.p.h.

EACH SIDE FRAME A MASSIVE STEEL CASTING

The mechanical parts are of considerable interest, having been designed in detail by the engineers of the railway to meet the exacting service conditions of the celebrated Elkhorn grade, which are unsurpassed in this country, if not in the world.

The construction of the new locomotives is fundamentally the same as the present ones, the system of drive being that of motors geared to jackshafts and connected to driving wheels by side rods. In the new locomotives, however, the four main driving axles form one rigid wheelbase, with continuous side frames from end to end of unit. The cab structure is carried on and rigidly connected to the side frames and cross-tie castings. This differs from the present locomotive, each unit of which has a cab structure supported on a number of springs and sliding bearings, carried on two main trucks, each having two main driving axles and one guiding truck axle, the two main trucks being connected by a Mallet hinge.

The new arrangement follows closely that of the Mikado type of steam locomotive, and also has a similar type of spring equalization.

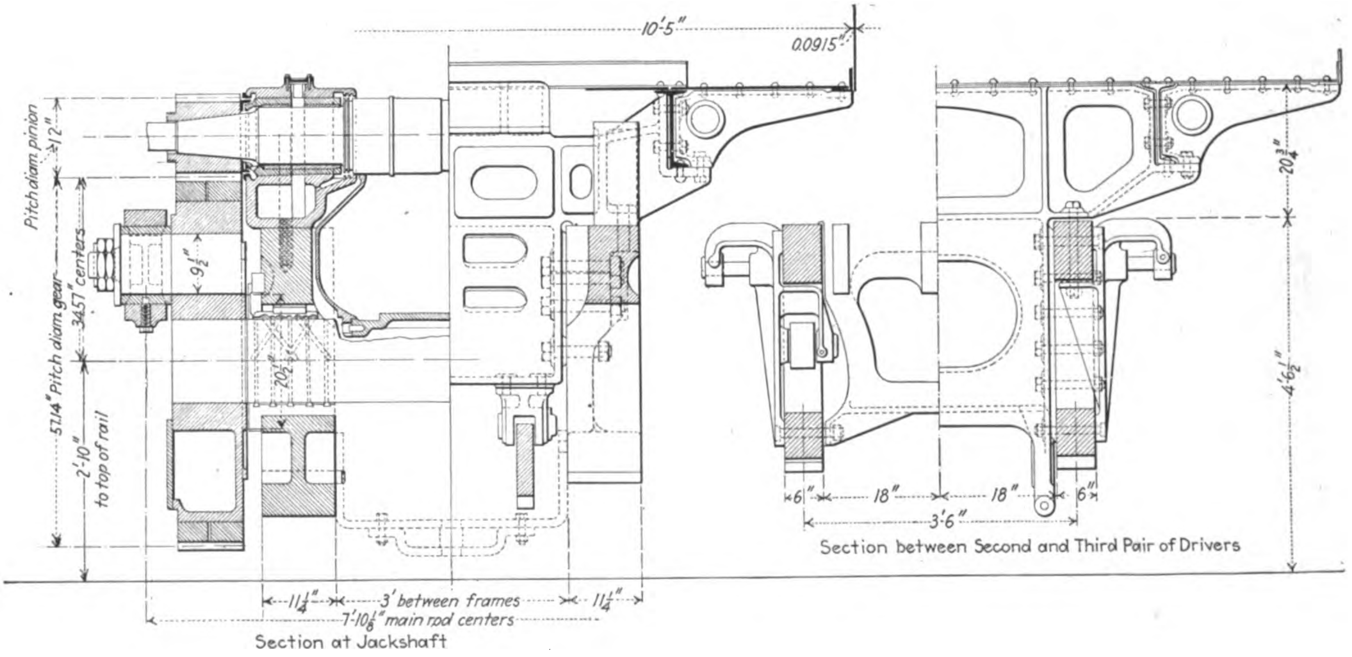
Side frames are to be vanadium steel castings connected by cross-tie castings which also serve to support the heavier parts of the electrical apparatus in the cab.

An interesting feature of the mechanical parts is the method employed for supporting the jackshafts. For ease in removal of jackshafts, which carry a gear at each end, these are carried on heavy bronze bearings, which are split vertically and rest in heavy steel castings known as "jackshaft cellars." These cellars are set in pedestal ways in the side frames and are inserted from below, in similar fashion to a journal box in its pedestal ways, except that the jackshaft cellar and the pedestals are very accurately fitted and the cellar is built with extensions at the bottom which act as a tie bar, being bolted to the side frames. This makes the cellar practically an integral part of the side frame, and at the same time provides a ready means of removal of the jackshaft. It is the same arrangement that has proved very satisfactory on the present locomotives.

The spring suspension system is the same as that in successful use on steam Mikado steam locomotives, the front guiding truck being side equalized with the two adjacent drivers and the rear truck cross equalized with the other two drivers, thus forming a three-point suspension.

The 1,000-hp. motors will, as suggested above, be arranged either for a four-pole connection, corresponding to a speed of 14 m.p.h., or an eight-pole connection, corresponding to a speed of 28 m.p.h. Each motor will have forced ventilation supplied through air ducts from individual motor-driven blower sets.

The motors are mounted on the locomotive framing in an interesting manner. The stator frame is cast with horizontal brackets running the full width of the motor.



Section at Jackshaft

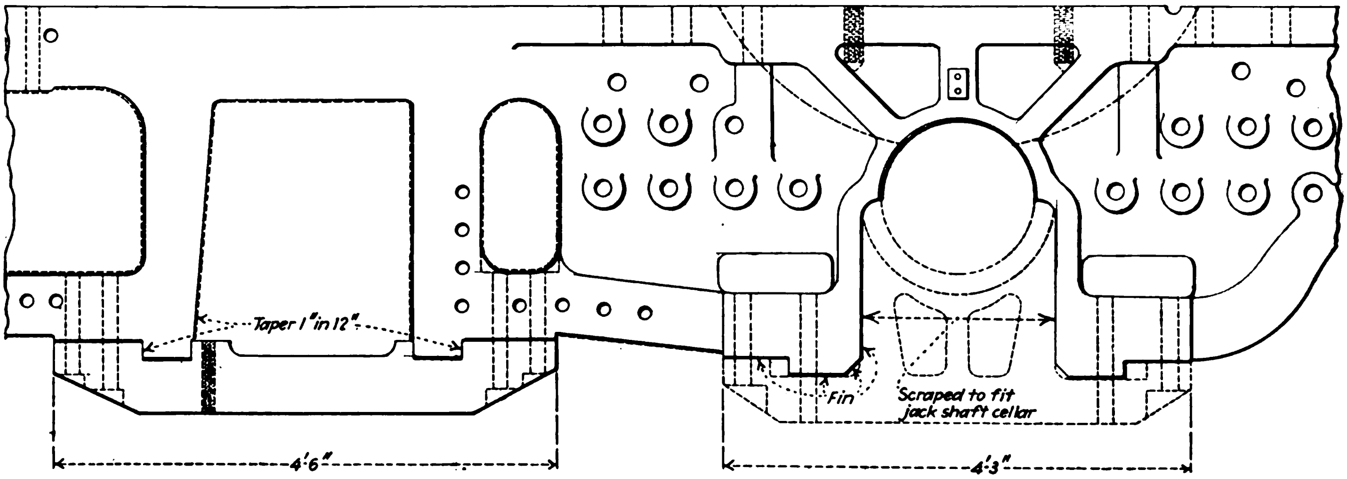
Section between Second and Third Pair of Drivers

POINTS. THESE ILLUSTRATE THE RUGGEDNESS OF THE CONSTRUCTION

These rest on heavy steel cross-tie castings connected to the main side frames. The weight of the stator is thus carried on horizontal planed surfaces which can readily be trued up in relation to the centers of jackshaft, rotor shaft and driving axles. The rotor is carried independently of the stator on bearings which rest in separate housings mounted on and secured to the main side frames, the proper relation of the stator and the rotor being maintained by accurate fitting of the bearing surfaces.

The collectors of the rotor motor will be mounted on the motor shaft outside the pinions, one three-ring collector at each end of the shaft. The leads from the collector to the rotor winding will be carried through the hollow motor shaft, well insulated and protected from abrasion. Means will be provided for removing the collectors without disturbing the leads in the shaft. This construction differs from the earlier machines, but it was used in the Pennsylvania locomotive already referred to.

The pinions will be made from individually forged steel blanks with twenty-eight machine-cut spur teeth, 1¾ diametrical pitch, 20 in. total face per jackshaft. The rims of the flexible gears will be made from individually forged steel blanks with 100 machine-cut spur teeth. These will be mounted on cast-steel centers with flexible elements interposed between the rims and the centers. The center will carry a wristpin and the necessary amount of counterbalance weight. The pinions and gear rims will be heat-treated.



THIS "JACKSHAFT-BEARING CELLAR" IN NO WAY WEAKENS THE SIDE FRAME

CONVERTER STARTING MOTOR WILL ALSO DO DUTY AS EXCITER

The phase converter will be a rotating machine with a two-phase wound stator and a wound rotor. One stator phase will be fed from the transformer and a proportional voltage will be generated in the other stator phase approximately 90 deg. electrically displaced from the transformer voltage. One terminal of this generating phase will be connected to a mid-point of the transformer and the other end to the one phase of the main rotor circuit. The other two motor leads will be connected to loads at the two ends of the main transformer secondary, resulting in a Scott connection to give three-phase power to the main motors.

This phase converter will be of the synchronous type, as already stated, which permits the transformation of power at high power factor. This means that the converter will be separately excited, the exciter being the same machine which serves as a starting motor for the converter.

This auxiliary machine will be a single-phase series-type commutator motor, mounted on the phase-converter shaft to bring the phase-converter rotor up to synchronous speed, after which this commutator machine will be reconnected as a direct-current exciter, separately excited from the motor-generator set to excite the rotor windings of the phase converter. The rotor, of course, will have two slip rings for supplying a starting current to the rotor windings.

OIL-COOLED TRANSFORMERS ADOPTED TO SECURE EXCELLENCE OF INSULATION

The transformer for each half unit will be of the shell type, oil insulated, forced cooled, built for mounting in the cab of the locomotive. This differs from the earlier machines, which had air-blast transformers. The extra weight was considered offset in the new units in view of the better insulation. An air-blast type transformer preventive coil will be provided to compensate for 15 per cent drop in voltage during acceleration and to minimize voltage unbalance during acceleration and regeneration. This will be of the same general construction as the main transformer.

A centrifugal pump will be used to circulate the transformer oil through an external radiator, and a blower will force air through the radiator in sufficient quantity to enable the transformer to perform its specified service. The pump and blower will be driven by a common motor, which will be forced ventilated by air taken from the blower.

A steel-plate electrode will be provided in the liquid rheostat for each phase of each motor. The electrodes will be rigidly supported through porcelain insulators and separated at the lower end by slate barriers. Steel ground plates will be interposed between the electrodes above the slate barriers, and in effect will form a separate compartment for each electrode. The electrodes for one motor will be removable as a unit. The electrolyte will be circulated by a motor-driven centrifugal pump, the motor being of the ball-bearing squirrel-cage induction type, arranged to start polyphase and run single-phase. In the cab the pump will supply electrolyte from a common storage tank, insuring that all electrodes of that cab are immersed in electrolyte of the same temperature and density.

A cooling tower for the electrolyte will be provided, consisting of a series of trays over which the electrolyte will flow in a thin sheet, while cooling air is circulated over the surface. The height of electrolyte around the electrodes will be controlled by a motor-operated overflow valve.

The control will involve the use of two types of switches, one with its individual piston and cylinder for each switch, the other in which several switches are operated collectively through cams mounted on a common shaft.

Each master controller will be provided with a speed lever, an accelerating lever and a reverse lever, with the usual mechanical interlocking to prevent false operation. The accelerating lever will be used to raise and lower the overflow valves in the liquid rheostat and thus control the speed and tractive effort.

Unit-type electrically controlled and pneumatically operated switches will be used for transformer-secondary switches, phase-converter switches and motor-overload and reversing switches, while the switch group for pole changeovers and motor-secondary short-circuiting switches will be of the cam type, electrically controlled and pneumatically operated.

An auxiliary controller will be provided with levers to control the phase converter and to set the transformer switches for running or regenerating. It will also include means for raising and lowering the pantographs; and for controlling the operation of the liquid rheostat.

HOW OPERATING RELIABILITY WILL BE SAFEGUARDED

Protective features furnished will include a time-element overload relay, arranged to trip the oil circuit breaker in case of sustained short circuit on the locomotive. Overload relays connected in two of the phases of each motor will be arranged to open the main motor switches on overload. Maximum-level relays, operated by electrolytic interlocks, to limit the height of liquid in the rheostat tanks to the proper points will prevent the motor secondary from short-circuiting switches from closing except when the liquid is at the maximum level. Contact on a drum mechanically connected to the overflow valve will prevent the motor line switches from closing on either the 14-m.p.h. or the 28-m.p.h. connection unless the overflow valves are at the desired height. A no-voltage line relay will be provided to open up circuits necessary for protection of the apparatus and interruption of power to the locomotive. The pole-changeover cam-type switches will be interlocked with the main motor switches so that the circuits will be always made or broken by the main motor switches.

Swedish Electrification Deferred

In its "Trade and Economic Review" for 1921, just published, the United States Department of Commerce analyzes the condition of the Swedish railways, stating that the financial depression was too serious to permit the completing of the electrification of the main line from Goteborg to Stockholm, the expense of which would have meant a deficit. The electrification of the Kiruna-Svarton line, however, is being carried on, its completion being expected during the present year. As a whole the State Railways were prosperous in 1921, a profit of more than $6,000,000 having been made, as compared with somewhat over $1,620,000 the year before. The private railways ran at a loss.

Letters to the Editors

Noiselessness in Special Trackwork

WILLIAM WHARTON JR., & CO., INC.

NEW YORK, N. Y., Dec. 26, 1922.

To the Editors:

In the issue of the *Electric Railway Journal* for Dec. 16, pages 944 and 945, appears an article describing two Balkwill track crossings furnished by this company to the Cleveland Railway. In the article the following statement is made: "The Balkwill crossing, of which noiselessness is but one feature . . ."

From the way in which this statement is worded it might be inferred that the noiseless feature can be secured only in the Balkwill crossing. The fact is, of course, that the flange-bearing throughout the crossing which constitutes the noiseless feature can be incorporated in practically any type of crossing, whether solid manganese steel or other steel, or T-rail built-up-type with filler or girder-rail crossing. The noiseless feature was incorporated in crossings and other special parts of layouts made by this company for a number of years, particularly in work made for the Kansas City Railways.

GEORGE R. LYMAN.

[NOTE—The sentence quoted by Mr. Lyman was inserted to point out that, while the Balkwill crossing, with the flange-bearing feature, was selected for the particular locations in Cleveland mentioned on account of their noiselessness, after all the unique feature of this type of crossing is its articulation. It was not intended to imply that the flange-bearing feature was unique, as flange-bearing special trackwork is well established in general practice.—EDITORS.]

Thinks Fault Lies Rather with High Supertaxes

NEW YORK, Dec. 27, 1922.

To the Editors:

I note with interest the editorial in your issue of Dec. 23 with the caption "Discontinuance of Tax-Exempt Issues a Benefit to All." The views expressed in your editorial support the recent resolution of the American Electric Railway Association and coincide with those reported as the views of the present Federal administration, but there are always two sides to every question, and with all respect to your own attitude and to the prominence of those who hold the same views, it seems to me such views are based on a superficial consideration of the subject.

We have always had tax-exempt issues and until a comparatively recent date they have never come in for much adverse criticism. They have always commanded a market at a materially lower rate of interest than competing non-exempt securities, yet there has always been a sufficient demand for the latter to furnish industry as much capital as it needed. There is no substantial, if any, difference between the tax-exempt securities of today which came in for so much criticism and those of former days which were free from such criticism, and therefore it seems to me to be jumping at a conclusion to lay the blame for the existing condition on the tax-exempt securities and to claim that they are put out on basically wrong principles. Rather let us inquire what has happened in other directions to give rise to the difficulties which now exist and see if we are not shooting at the wrong target in condemning the tax exempts.

To my mind the facts are fairly obvious, i.e., with mistaken zeal to extract an unfair, unjust and a wholly unreasonable income tax from men of large means, our legislators have enacted into law a super-tax schedule which puts such heavy taxes on this class of citizens as to be nothing short of ridiculous. The fact that this schedule is so manifestly unjust has had no effect on Congress because the number of very wealthy men is comparatively small. They cannot, therefore, deposit many votes, and owing to the fact that all of us are more or less jealous of those who are better off than we are these same wealthy citizens get very little sympathy from any one else. If press reports are to be credited, the income taxes received by the United States from this very wealthy class are diminishing from year to year, a condition doubtless brought about because our wealthy men are rapidly learning how to deal with the situation so as to comply with the law and escape being robbed. Of course one means to do this is to invest in tax-exempt securities, and the American Electric Railway Association has pointed out that this tendency has reached such proportions as to withdraw large amounts of capital otherwise available for industry and to bury it in comparatively dead projects; that is to say, dead in so far as they contribute to the progressive, constructive up-building of our industries. It would seem to me clear that the natural cure for this condition is not to do away with tax-exempt securities, which serve a very useful purpose, but to correct the obviously unwise and unjust schedule of super taxes, which, as is reported, are yielding the government a steadily decreasing revenue, and by so doing remove the cause of the trouble instead of trying to stop the effect.

It has been frequently claimed that the great mass of the people are suffering by having to pay taxes to take the place of those which ought to be collected from the wealthy class were they not permitted to invest their money in tax-exempt securities. But I have never yet seen attention called to the fact that if tax exempts were prohibited every bond hereafter issued by a municipality or state or the nation would have to pay a considerably higher rate of interest and therefore that the so-called common people would likewise have to pay a correspondingly greater amount in taxes to cover such greater interest, and to pay it not only on the securities now bought by the wealthy people but also on the very large volume of the same securities which are bought by those who do not purchase them for the sake of saving income tax payments but on account of their safety as an investment.

I do not own one dollar's worth of tax-exempt securities and therefore am not personally interested in saving myself taxes by having them retained, but I would like for once to see the American people courageous enough to face the facts and to apply a remedy where a remedy belongs, and I would like to see a full and free statement in the public prints, not a continued harping on one side and ignoring of an obvious weight of evidence on the other. CALVERT TOWNLEY.

News of the Associations

The Pass in Tacoma*

After Only Fifteen Weeks the Tacoma Railway & Power Company Is Selling 11,000 Passes Weekly in a City of 100,000 Population—Riding Up 20 per Cent and Car-Hours 2.7 per Cent

BY C. V. ALLEN
Publicity Manager Tacoma Railway & Power Company

STREET RAILWAYS all over the United States have been in a serious financial predicament in the last ten years for well recognized reasons. The Tacoma Railway & Power Company, while more fortunate than some other companies in that it had a 10-cent fare, nevertheless was faced with serious financial difficulties. Heavy pressure was being brought to force our fares to 5 cents, jitneys were to be started in competition with us, and the privately owned automobile was cutting into our earnings deeply. The street railway pass seems to us to be a ray of light at this time. While it has been in effect here but fifteen weeks, and we are really novices in the game, we think that it has given us the first assurance we have had in many years of financial success.

A large part of the credit for revising this pass from European models and making it workable in the United States is due to Walter Jackson, an independent traction engineer of Mount Vernon, N. Y.

Tacoma is the sixth city in the United States to install the pass and is really the second large city to do so. Tacoma's population today is about an even 100,000. The form of pass used on our lines here follows closely that used in other cities where it is used. The face of the pass carries the following wording:

> Pass bearer on cars of these companies within the one-fare limits of the city of Tacoma within the days shown on the face of this pass. Pass is to be shown car operator or conductor and is good for only one passenger and shall be in passenger's possession while on car.

This pass is absolutely transferable. The holder can loan the pass to his wife, children, or to anyone he may desire and there is absolutely no question asked as to his right to use the same. The pass entitles the holder to ride upon any cars operating within the city limits, at any time, for any distance, for a block or for a mile. The pass is good from the first car Monday morning to the last car on Sunday night.

The convenience and economy of the pass can be shown by the uses to which it is put in Tacoma. The wholesale dealers who have in the past paid the street car fares of their city salesmen at a cost to them of 50 cents to $2 a day, now furnish them with the $1 pass, which is good for all riding they can possibly do during the entire week. Banks buy a number of them and the messengers use them as they go on their errands and return them to the office when they are through. Men and women working downtown who formerly paid 35 to 50 cents for their lunches now use the pass to go home and are able to save the price of it in approximately three days. This transferable quality of the pass has made it most popular.

TRANSFERS CUT IN HALF

Another advantage of the pass is the doing away with transfers. We issued weekly between 110,000 and 120,000 transfers. Every one of those transfers represents a potential row. Our trainmen have more arguments over transfers than anything else in connection with our business. The pass to date has practically cut the number of transfers issued in half.

The pass is really the first opportunity street railways have had to merchandise their transportation. Under the old fare system, a patron approaching a car was greeted with this little sign on the side of the entrance, "Have your exact fare ready." Here is a command. There is nothing pleasant about that little order. As he steps on the platform he glances up and sees the sign, "Ask for your transfer when you pay your fare." If he omits to do so, he will either have to go back and plead with the conductor to give him a transfer, in violation of orders, or else pay another fare on the next car. As the passenger takes his seat, he is greeted with the sign on the end of the car, "Warning! Not more than thirty days and not more than $100 fine for the abuse of the transfer." That little sign isn't particularly encouraging or pleasing to the patron. He looks at his transfer, and on it is the statement that it must be used for the next connecting car. If he fails to do so, the inference is that he will have to pay another fare. It also states that the transfer must be made at a certain definite point. If he moves one block either way from the point of transfer, his transfer is rendered invalid.

---

*Abstract of paper read before Building Owners and Managers' Convention at Tacoma, November, 1922.

All of these things make riding unpleasant and discourage it in every way. The pass absolutely eliminates all these annoying regulations. The passenger is free to get on or off without any question of any kind.

MORE PASSES—FEWER JITNEYS

The people of Tacoma have shown every evidence of liking the pass. The first week we sold 7,000 passes. Today, we are selling 11,000, which shows an average increase of approximately 250 per week over each preceding week. In order to do this, we have had not only to resell every purchaser that bought one the previous week, but we had to sell 250 additional. The fact that the sales have fallen off only in one week, and that the week of Labor Day when Monday was a holiday, speaks well for the popularity of the pass in Tacoma.

Just prior to the installation of the pass system there were some forty-eight jitney buses licensed to operate in Tacoma. Today, the latest reports we have show about fifteen operating and the number gradually falling off each week.

THEATERS BOOST NOW—ALSO THE MERCHANTS

Just prior to the installation of the pass the leading theaters in the city carried slides urging the public to support the demand for 5-cent fare. The slides had statements something like this:

> Let's all pull together for a 5-cent fare. A 5-cent fare will help business. Get behind the 5-cent fare movement.

We approached the theaters and explained to them our plan to put in the pass system. The idea of the pass appealed to the theaters. They advised us that they would drop the slides urging the 5-cent fare and would advertise our pass system. This they have done ever since.

The leading retail stores in the city have seen the beneficial effect of the pass in getting people to move and have joined with us in our advertising campaign. They have put on special Monday sales, using much space in the Sunday papers, and have suggested at the top of the "ad" the use of the pass, or recommended the purchase of one. The idea back of it is this: With an attractive Monday sale they could probably draw the women downtown for those sales. We are interested in their coming down on Monday for we have a much better chance to sell them a pass if they come downtown on Monday for they would have the rest of the week to use it. The stores also would be benefited, because after the women have purchased the pass, they would probably go down to any other sale the stores might have during the rest of the week.

One of the leading banks in the city is now planning to put out a passholder which is to be given away without charge—a small leather case bearing the name of the bank.

NIGHT SCHOOL ATTENDANCE UP 50 PER CENT—ADVERTISING METHODS

The night schools in Tacoma have advised us that their business has increased nearly 50 per cent since the pass was put in. They, too, have given us considerable publicity in their advertising. We are able to reciprocate in our advertising, and this in itself creates good will.

We are using posters in the windows of our cars. These posters and their color are changed every week, and may be read from the street or from the inside of the car. On the outside is a short, snappy statement like this, "Save Gas and Shoe Leather with a $1 Weekly Pass." We elaborate a little on this same idea on the side of the card to be read by the passenger in the car. In our opinion this form of advertising is the most effective we've done.

We have placed billboards at the most important automobile and street car traffic arteries with the wording, "Just Park Your Pass in Your Pocket." This has been very striking advertising and very effective as well.

CHEATING ON THE PASS IS INCONSIDERABLE

An interesting feature of the pass about which we are often asked is the possibility of beating the company—cheating on the pass. Youngstown found some buyers were splitting their pass with a sharp instrument—one man taking half of the pass and one the other. This difficulty was easily eliminated by printing the pass on but one side. Another trick is that of cutting the pass in two pieces—the man getting on the car reaching in his vest pocket and pulling the pass out part way, the conductor taking it for granted that he has the whole pass. This is being eliminated by instructing our men to have the passholder show his complete pass. It is done by a card in the vestibule with the wording "The Best Way," a hand being shown holding the pass to display it fully. You will notice there is no command or order in the thing, merely a suggestion.

Another trick worked is that of passing the pass out the window where a considerable number of people get on the car—take for instance at heavy loading places—one man can board the car, go through and take a seat and pass the card out the window to a friend, who in turn boards the car.

We feel, however, that the loss through these dishonest channels is practically negligible; and rather than cause any unpleasantness or arguments with anyone over the pass, no regulation of any kind will be made as to this practice.

INDUSTRIAL CONDITIONS STILL BELOW PAR

Most street railway men will probably be interested in the financial working out of the pass. Our report issued for the fourteenth consecutive week shows that the average rides taken by passholders per week is nearly twenty-seven. This is an average of nearly four car rides per day, which gives the holder of the pass his car rides at approximately 3.75 cents each.

The pass is, of course, an equivalent to a lower fare, and it is expected that our earnings will be somewhat under normal. The first few weeks of the pass worried us—our gross earnings dropped to approximately 20 per cent below the normal earnings of a year ago at this time. However, as the pass sales increased this drop in earnings became less and less until under this report (fourteenth week) our earnings have reached within 7.7 per cent of normal. In other words, the curve of our earnings is gradually drawing toward the line of normal earnings. We anticipate that with the entire elimination of the jitney bus, and the resumption of full working crews at the Milwaukee and Northern Pacific shops, our gross earnings will reach normal and undoubtedly go above our normal earnings line.

THEY DO COME BACK TO THE TROLLEY LINES

I think the must interesting point about the pass is the increase in riding. We carry normally at this time of year about 480,000 passengers per week. The pass has brought up our riding nearly 20 per cent, the week of this report showing 565,413 passengers carried. This increase in riding is one of the most healthful features inherent in the pass.

Also, it is shown by the report that the riding is not during peak loads. The total increase in car-hours to carry this 100,000 additional people was but 2.7 per cent. In other words, the most of the increased riding is during periods when our cars would be running empty, and this increase in traffic is costing us practically no more in additional service.

Therefore, taking every phase of the pass, we feel more pleased with it each week. We think the pass is going to be a permanent institution and that it has put us around the corner.

Annual Meeting of American Engineering Council

THE American Engineering Council of the Federated American Engineering Societies will hold its annual meeting in Washington, D. C., on Jan. 11 and 12. The meeting will consider problems of national interest, including the report of the committee on work periods in continuous industries, of which the electric railway industry is one. Dean Mortimer E. Cooley, University of Michigan, president of the federation, will preside.

The climax of the meeting will be a reception to Prince Gelasio Gaetani, Italian Ambassador to Washington, who recently arrived in this country. The new diplomat is an engineer by profession.

Rousing Meeting of Tennessee Utility Men

THE establishment of good public relations, the significance and importance of regulation by utility commissions and the value to the utility industry of the Tenessee Public Service Information Bureau were the principal themes occupying the attention of the first public utility conference held in Tennessee, when more than one hundred operators gathered at the State University in Knoxville on Dec. 14. The meeting was called by Percy Warner, chairman of the Tennessee Public Service Association.

One of the principal addresses of the day was by Julian H. Campbell, chairman Tennessee Railroad and Public Utilities Commission. In speaking on "The Public's Interest in the Public Utilities Commission" Chairman Campbell defined the duties of the commission by telling the utility men that the orders of the regulating body must inspire the confidence of the public and still provide an incentive to the utility so that the utility may better its conditions and cheapen its costs.

Another address of great importance to the utility men was that by Lovick P. Miles of Memphis, general counsel Memphis Street Railway. He declared that the average street car rider or water, gas or electric customer seldom pauses to reflect on the great value of these services. He related the history of the regulation of utilities and emphasized the fact that the plan for a state tribunal with complete jurisdiction is now generally regarded as the best means to compel the utilities and the public to discharge their obligations to each other.

In welcoming the utility men to the University of Tennessee, President H. A. Morgan said: "It is a fact that must be admitted that people are not fair. They do not appreciate the various problems you confront and we of the university are happy to have you here as a move to bring about a better understanding."

The work of the Tennessee Public Service Information Bureau, founded six months ago by the utilities of the State, was explained by Ross Murphy, the director, who reviewed the conduct of the bureau and expressed appreciation of the welcome it had received throughout the State.

Engineers Draw Up Code of Ethics

A JOINT committee representing several national engineering societies has prepared a code of ethics which has been adopted by the A.S.M.E. and will presumably be adopted shortly by other leading societies. The text of the code is as follows:

Engineering work has become an increasingly important factor in the progress of civilization and in the welfare of the community. The engineering profession is held responsible for the planning, construction and operation of such work, and is entitled to the position and authority which will enable it to discharge this responsibility and to render effective service to humanity.

That the dignity of their chosen profession may be maintained, it is the duty of all engineers to conduct themselves according to the principles of the following Code of Ethics:

1. The engineer will carry on his professional work in a spirit of fairness to employees and contractors, fidelity to clients and employers, loyalty to his country and devotion to high ideals of courtesy and personal honor.
2. He will refrain from associating himself with, or allowing the use of his name by, an enterprise of questionable character.
3. He will advertise only in a dignified manner, being careful to avoid misleading statements.
4. He will regard as confidential any information obtained by him as to the business affairs and technical methods or processes of a client or employer.
5. He will inform a client or employer of any business connections, interest or affiliations which might influence his judgment or impair the disinterested quality of his services.
6. He will refrain from using any improper or questionable methods of soliciting professional work and will decline to pay or to accept commissions for securing such work.
7. He will accept compensation, financial or otherwise, for a particular service, from one source only, except with the full knowledge and consent of all interested parties.
8. He will not use unfair means to win professional advancement or to injure the chances of another engineer to secure and hold employment.
9. He will co-operate in upbuilding the engineering profession by exchanging general information and experience with his fellow engineers and students of engineering, and also by contributing to work of engineering societies, schools of applied science and the technical press.
10. He will interest himself in the public welfare, in behalf of which he will be ready to apply his special knowledge, skill and training for the use and benefit of mankind.

New York Association's Midwinter Meeting

THE executive committee of the New York Electric Railway Association has selected Thursday, Jan. 25, for the twenty-sixth midwinter meeting. This will be held in New York City at the Hotel Commodore.

Already the acceptances to invitations to address the gathering which have been received by the executive committee are sufficient to insure a valuable and interesting program, the details of which will be announced in a few days.

American Association News

Construction and Maintenance of Highways

A MEETING was held at the association headquarters in New York on Dec. 15 of the committee of the American Association on construction and maintenance of highways for motor vehicles. This committee was appointed last summer to collect data on this subject because of the seeming lack of authoritative information. There was not sufficient time to prepare a report for submission at the Chicago convention, but the committee sent out a questionnaire and is collecting records from various sources. The meeting on Dec. 15 was to go over the material received. Replies to the questionnaire were considered satisfactory, but those replies lacking in essential data will be followed up by correspondence and other sources of information on the subject will be followed up. Those in attendance were W. J. Harvie (chairman), Syracuse, N. Y.; C. F. Cheney, Des Moines, Iowa, and E. P. Roundey, Utica, N. Y.

"One-Man Cars Decrease Accidents"

THE Information Bureau of the association has sent out some information in "blanket" form giving a list of some of the electric railways using one-man cars, opinions and statistics in regard to the accident record of these cars as compared with two-men cars, and some typical safety "ads," usable in a one-man car campaign.

Connecticut Company Section Elects Officers

AT THE ANNUAL and forty-fourth monthly meeting of the Connecticut Company section, held in Waterbury on Dec. 13, the following were elected to the positions named: President, S. W. Baldwin; vice-president, E. T. Chapman; secretary, C. K. Savery; treasurer, George H. Crosson; director for three years, J. B. Potter.

May Offer Traffic Proposal

Companies Hold Conferences Which May Lead to Operation of Subway—Benefit to City and Railways

Tentative discussions which may lead to a proposition to the Rapid Transit Commission of Cincinnati, Ohio, from the Ohio Traction Company and the Cincinnati & Dayton Traction Company for the use of the rapid transit subway have been held recently between the interested persons, according to statements made by directors of the Cincinnati & Dayton Traction Company. The proposition involves bringing passengers from the Miami and Millcreek Valleys into the city by the subway.

Nothing definite has been done and nothing can be done until action is taken by the Ohio State Supreme Court regarding litigation over a bondholders' lien, in which decisions have been rendered by two lower courts in favor of the committee of bondholders of the two traction companies.

Leo J. Van Lahr, chairman of the bondholders' committee, said that the committee expects the decision of the Supreme Court to be handed down within a short time, and if the decision is favorable the committee will be in a position to make a proposition to the Rapid Transit Commission.

The Cincinnati & Dayton Traction Company would be a great feeder to the retail district of Cincinnati. Acquiring use of the subway, the traction company could bring into the city buyers from the Miami and Millcreek Valley sections up as far as Dayton who now do not patronize the Cincinnati market because of inadequate transportation facilities.

Mr. Van Lahr said that even if a transfer were necessary the traction company could do this at small cost, land its passengers at the junction of the rapid transit loop and Spring Grove Avenue and turn them over to shuttle train service to be taken into the heart of the shopping district. There would be a saving of at least ten minutes by this arrangement.

Martin Ackerman, general manager of the Cincinnati & Dayton Traction Company, said that the company is not trying to obtain the right to operate the Cincinnati subway, but merely trying to negotiate for authority to operate its cars through the underground railway from its present terminus at Spring Grove Avenue to the central section of the city.

Mr. Ackerman said that he had been in conference with the engineering department and expected to see the Rapid Transit Commissioners shortly. He said he believed that such an arrangement as is contemplated will be mutually beneficial to the railway company and the city of Cincinnati.

Recently Mr. Ackerman made inquiry at the City Hall as to whether or not the subway was to be abandoned. He was told unofficially at the time that the commission was not disposed to abandon the proposition even temporarily, but that construction would continue as long as a dollar of the $600,000 voted by the people for the purpose remains.

Mr. Ackerman also inquired as to whether the cars of his company would be permitted to operate in the loop. He was told that to do so would defeat rapid transit. Special cars will be operated in the loop and he was informed the passengers from the connecting lines would have to transfer to the loop. The subway likely will be completed to Spring Grove Avenue within a year.

The traction company operating the loop, he was told, would have to supply the current as well as lay the rails and contract for the rolling stock.

Utilities in Ohio Grow in 1922

The expansion of Ohio's utilities during 1922 is made the subject of an instructive article in the Dec. 16 issue of *Finance & Industry*. The writer, Benjamin E. Ling, director of the Ohio Commission on Public Utility Information, illustrates in tabular form the general business revival in Ohio. Referring to the securities authorized for issuance by the Public Utilities Commission, he shows that for refunding and reorganization purposes the electric railways were authorized by the commission to issue in securities $25,170,192 and for additions and betterments $8,758,650.

Will Consider Further Deferment of Tax

Mayor George P. Carrel of Cincinnati, Ohio, has appointed A. E. Anderson, vice-president of the Procter & Gamble Company; Vice-Mayor Freene Morris and Maurice J. Freiberg, Cincinnati financier, members of a sub-committee of the Citizens' Traction Committee to consider the advisability of recommending to the City Council a further deferment of the Cincinnati Traction Company's franchise tax. The limit set by the Council last year was Jan. 1, 1923. Unless the Council again defers the payment, an increase in fares soon after the first of the year is anticipated since the receipts of the company are not sufficient to pay all operating costs and the franchise tax as well. Another committee was named to consider the status of the franchise of the traction company to ascertain if any act has been committed that would justify forfeiture proceedings. Both sub-committees were suggested in resolutions adopted by the general committee at its meeting on Dec. 14.

Order Annulled

Court Over-rules Decision of Commission Ordering Construction of Joint Union Passenger Terminal

The California State Supreme Court on Dec. 19 annulled the order of the State Railroad Commission directing the steam road and interurban railway lines entering Los Angeles to join in the construction of a union passenger terminal on the old Plaza. The decision halts development under way in Los Angeles, a scheme whereby railroad passenger traffic would be concentrated for the public convenience, grade crossings eliminated and the city possess a terminal similar to those of large Eastern cities.

It was the opinion of the State Supreme Court that the Railroad Commission had exceeded its jurisdiction in ordering the project. This was the contention of railroad officials in Los Angeles when they appealed the commission's order in January, 1922. The commission issued its order on April 26, 1921.

The railroads insisted that the only governing body with authority to order the construction of a union passenger terminal depot was the Interstate Commerce Commission. The court upheld this view, ruling as follows:

> We arrive at the conclusion that full power and authority over the matter of union terminal depot facilities of the railroads largely engaged in interstate commerce have been vested in the Interstate Commerce Commission and that the State commission has been divested of this power.

The railroads affected by the order were the Southern Pacific Lines, Union Pacific System, Atchison, Topeka & Santa Fé Railway and the Pacific Electric Railway, each of which now has a separate station.

The Railroad Commission's order called for plans for the new union station to be filed with that body within six months; also, the plans called for a gradual elimination of grade crossings and other features of a comprehensive scheme for transportation development meeting present, as well as future, requirements. The commission laid out five years as the period needed to complete its plan. The supervision and direction of the construction of the union station were to have been done by a committee composed of two men appointed by the city of Los Angeles and two by each of the railroads, a disinterested party to be chosen as chairman.

The railways at once announced they would fight the commission's order, and soon after petitioned the Supreme Court to order the issuance of a writ of review of the case. The court on Jan. 5, 1922, ordered the Railroad Commission to make a return of all of its proceedings and the case since has been pending.

The campaign for a union passenger terminal in Los Angeles began in 1911, following a series of accidents which emphasized danger of grade crossings. Several associations petitioned the State Railroad Commission for relief by ordering the abolition of the grade crossings, but the commission feared that it lacked proper jurisdiction in this direction and ruled against itself. The matter was taken before the Supreme Court, which then held that the commission had full authority to cope with the situation.

The feature of the commission's order was made to include the elimination of grade crossings reaching as far inland as Pasadena and embraced upward of 150 grade crossings in and near Los Angeles. The railroads entered no objection to this feature of the order, but they did oppose an order to construct a union station.

Since the Supreme Court has now seen fit to reverse its former decision, the city of Los Angeles contemplates asking the court to grant a rehearing on the terminal case. Also, the commission will make similar appeal to the courts, and if it fails the commission will appeal at once to the Interstate Commerce Commission for an order directing the Southern Pacific, Santa Fé, Union Pacific and Pacific Electric Railway lines to join in a union terminal. The decision does not affect the commission's right to order the abolition of grade crossings. The Interstate Commerce Commission will be asked by the commission to place the case at the head of its 1923 calendar, if an appeal to that body is found necessary. The State Railroad Commission is ready to place before the Federal commission a complete record of the case, including elaborate traffic studies made by the commission's engineers.

The Supreme Court's decision did not condemn the Plaza site for the proposed union terminal, but the decision was one that simply decided the State Railroad Commission had undertaken to avail itself of the Interstate Commerce Commission authority.

Agree on Scale of Sixty Cents

The long-threatened strike of the employees of the Gary & Southern traction line, running from Crown Point to Gary, Ind., was averted recently when the company heads and the unions reached a compromise agreement.

Several months ago when the company declared a reduction in wages, the men threatened to walk out. By an arrangement with the company officials and the Chambers of Commerce of the terminating cities the strike was averted through the three organizations agreeing to pay the scale in force until a wage agreement could be reached.

At the recent meeting of the officials of the traction line and the employees, the latter agreed to accept a wage scale of 60 cents an hour—a reduction of 6 cents an hour from the former scale.

An Attempt Made to Throw Out Brooks-Coleman Act

Agitation has been started to secure the abrogation of the Brooks-Coleman act passed at the 1921 legislative session in Minnesota. This act put street railways under control of the State Railroad & Warehouse Commission as to rates. While it has been defended as an able law, some radical elements are opposed to it. It is said that the abrogation of the law would probably nullify all the preliminary work that has been done to establish property valuations of the railways in Duluth, Minneapolis and St. Paul.

Business men in the Midway district of St. Paul, from which formerly there was a one-fare rate to the centers of either city, subject to transfer also, seek an amendment at the legislative session which opens in January to unify the trolley systems of the Twin Cities. Minneapolis aldermen will opose this change on the theory that the St. Paul system is kept up financially by the Minneapolis receipts. They believe the St. Paul City Railway should take care of itself. The St. Paul Association of Public and Business Affairs will ask a conference with Minneapolis business men on the subject.

Meanwhile the valuation proceedings hinge upon the final outcome of the suit by Minneapolis to get additional facts from the Twin City lines.

Wages Advanced in Louisville

The Louisville (Ky.) Railway has added $60,000 to its yearly wage outlay by announcing increases for 900 employees effective on Jan. 1. The new scale will be 34 cents for the first three months, 37 cents for the next nine months; after one year 40 cents and after two years 45 cents. The present rates are 33 cents for the first year, 35 cents for the second year, 37 cents the third, 39 cents the fourth, 41 cents the fifth and 43 cents after five years. The average pay of men for the new year will be $130 a month. Operators of safety cars will have a scale 3 cents higher than others. The announcement of the wage advance came from President Barnes in time to help make Christmas a "merry" one. Mr. Barnes said that the general committee of the Co-operative Welfare Association, representing employees, requested the increase in order to put wages on a basis with other crafts.

E. F. Kelley, secretary to President Barnes, in discussing the wage increase announced for the carmen, called attention to an editorial on the subject in the Louisville *Courier-Journal*. This editorial shows a real human understanding of things and the different feeling of the press today as regards the company and what it does. It read in part as follows:

> The New Year increase of wages is announced by the Louisville Railway early enough to make the carmen's Christmas brighter than it would have been in other circumstances.
>
> The public has an interest in the welfare of employees of a street railway system. Men sufficiently paid are in better humor than men poorly paid, and fit for better service than is rendered by employees who feel that they have ground for complaint.
>
> Sensible persons—and sensible persons are a majority—want to see the street railways that pass their doors do well enough to warrant their improvement and extension from time to time as the demands upon them increase, and they want to see the men on the cars, and the men employed elsewhere by the company, well provided and content.
>
> The advance of wages announced is not so large that every employee will feel that he is getting everything he deserves, but in no business would it be possible to draft the plan of an increase of pay that would meet every requirement of every employee.
>
> When the carmen received 16 cents an hour, or less, the fare was 5 cents. The single fare now is 7 cents, but checks are purchasable at 6 cents. The motorman whose pay is about three times what a motorman received in 1905 and more than twice what he received in 1912 cannot feel that he is left out of consideration by a soulless corporation which has procured an increase of fares.
>
> That this is true is pleasing to Louisvillians who make use of street cars, and who realize that greater efficiency, and more courtesy, may be expected of the carman who feels that he is making progress.

Employees Armed in Buffalo—Emergency for Bus Operation May Be Announced

Loyal employees of the International Railway who are now operating cars in Buffalo have been armed with revolvers because of the frequent attacks which are being made upon the cars and their crews by striking employees and their sympathizers. County Judge Thomas H. Noonan has issued permits to carry firearms to a large number of platform employees of the International.

In defending his own action, Judge Noonan said he believes the men are entitled to protection by firearms. He said that permits in each and every case are granted only when an official of the traction company vouches for the applicant.

Mayor Frank X. Schwab of Buffalo has threatened to declare the existence of an emergency authorizing the operation of buses in Buffalo on Jan. 1. Such a step was taken by the Mayor at the outset of the strike of the trainmen in the employ of the International Railway, July 1, when numbered permits were issued to bus drivers by officials of the city at the City Hall.

Notice has been served upon the International Railway that such a step will be taken unless street car service shows a material improvement before Jan. 1, 1923.

Five striking platform employees of the International are under arrest in Niagara Falls charged with interfering with the operation of railway lines by attacking local cars and their crews in Niagara Falls.

Apparently every effort is being made by the municipal authorities to harass the International Railway in its fight against union domination. It is announced by Mitten Management, Inc., which operates the local and interurban lines of the International, that the company now employs more platform men and shop workers than before the strike and that the strike for union recognition is now regarded as a dead issue by it.

Pass Abandonment Recommended in Youngstown

The street railway committee of City Council has recommended to Council and to the Youngstown Municipal Railway a rearrangement of rates of fare which would involve the discontinuance of the weekly pass, which has been used on the city lines since October, 1921.

The proposed rate of fare which has been referred to the company for consideration is 10 cents cash, eight tickets for 50 cents and free transfers.

The present rate of fare is 9 cents cash, six tickets for 50 cents, 1-cent charge for a transfer and the unlimited ride weekly pass, which sells for $1.25.

The company has not yet replied to the committee in regard to the proposal.

Improvements Depend Upon Outcome of Franchise

A. W. Harris and M. H. McLean of the Harris Trust & Savings Bank, Chicago, owners of the Des Moines (Ia.) City Railway, were in Des Moines recently inspecting the plant and in a public interview Mr. Harris announced that future extensions and improvements of the Des Moines plant were dependent very largely upon the outcome of the franchise suit which at that time was before the Iowa Supreme Court for consideration but has since been decided in favor of the company.

If the franchise is held valid by the high court Mr. Harris declared that the company would make extensive improvements. He directed attention to improvements now under way and which have been completed during the past few months. A number of lines have undergone extensive replacements, and service at the present time is the best that the city has ever known.

Public feeling toward the company has changed greatly in the last fourteen months. Now aside from the little "band of irreconcilables" in the praise of the service of the Des Moines City Railway and of its treatment of patrons.

General Manufacturing Department of G. E. Reorganized

In several announcements issued on Dec. 29 by Vice-President G. E. Emmons a reorganization of the general manufacturing department of the General Electric Company is proclaimed. This reorganization, which is effective on Jan. 1, 1923, includes the appointment of H. F. T. Erben, heretofore manager of the Schenectady Works, as vice chairman of the manufacturing committee and ranking a member of the general manufacturing staff.

The vacancy thus created in the position of manager of the Schenectady plant is to be filled by the advancement of Charles E. Eveleth, who has been serving since Sept. 1 as assistant works manager under Mr. Erben. Mr. Eveleth will become works manager. J. A. Smith will continue as general superintendent and in the absence of Mr. Eveleth will be in charge of the works.

The membership of the manufacturing committee and the appointment of a sub-committee, to be known as a committee on appropriations, is also announced. The general manufacturing department, of which Vice-President Emmons is in charge, will be as follows: H. F. T. Erben, vice-chairman of manufacturing committee and ranking member of the staff; J. T. Broderick, secretary of the manufacturing committee; L. G. Banker, general purchasing agent; M. C. Fitzgerald, manager of transportation department; W. C. Fish, manufacturing engineer; W. B. Curtiss, supervisor of production; G. S. Maxwell, supervisor of costs; E. Z. Steezer, supervisor of industrial relations.

Interurban Line Favors Substitution of Buses Under Present Conditions

If bus transportation can be provided at lower cost with equal advantages of traction car service, the Indiana, Columbus & Eastern Traction line will abandon its electric traction service and enter the motor bus field. This was the gist of a statement issued on Dec. 27 from the local headquarters of the company in Springfield, Ohio.

The traction company is one of the largest in the state and is a pioneer in electric railway development in Ohio. It was a part of the Ohio Electric Railway system until the latter was dissolved some months ago by order of the federal court. The company has established a bureau of motor transport which is now engaged in compiling statistical data on the operation of bus lines. This bureau is in charge of O. E. Minnick, assistant engineer.

In making public the company's statement of Dec. 27 Arthur V. Bland, head of the Department of Public Relations of the traction line, pointed out that bus lines fixed their own rates, that their roadbed was furnished without cost to them and that for this reason their expenses were lower than those of the railway. If this situation was to be continued, he added, the traction company desired to take advantage of it, "as it makes no difference to us whether we transport on rubber or steel."

$1,250,000 in Improvements

President B. J. Denman of the Tri-City Railway & Light Company has announced that improvements amounting to $1,250,000 would be made at the central station in Davenport, Iowa, operated by the People's Power Company and furnishing electrical energy for the tri-cities, Muscatine and scores of small towns and farms in that vicinity.

The installation of a triple generator and a 35,000-hp. steam trubine will constitute the major part of the improvement. The work will take eighteen months to complete. New boilers and auxiliary equipment, an addition to the present central station and other impovements will constitute part of the development.

This new equipment will increase the capacity of the plant approximately 40 per cent, Mr. Denman estimates. Plans for the installation are now being prepared by G. T. Shoemaker, engineer of the United Light & Railway Company.

The construction department of the United Light & Railways Company will have charge of the installation of the turbine and auxiliary equipment.

So rapidly has the demand for electrical power grown in the industries of the tri-cities during the past few years that the present plant will reach its capacity soon. In order to provide for the demands of the future the company has decided to increase its installation.

News Notes

Subway Plan Disapproved. — The Board of Estimate of New York City has rejected the plans of the Transit Commission for a $69,000,000 subway in Manhattan, which was to have been known as the Eighth Avenue-Amsterdam Avenue line. It was to extend from Chambers Street uptown to Overbrook Terrace and Fort Washington Avenue.

Notice Given of Indeterminate Permit.—The Winona Interurban Railway, Warsaw, Ind., has filed notice with the Indiana Public Service Commission of its intention to surrender local franchises and permits and operate under an indeterminate permit under the jurisdiction of the commission. The company holds franchises in four counties and six cities of Indiana.

Will Do Business in Texas.—Southwestern Gas & Electric Company, incorporated under the laws of Delaware, with home office in Texarkana, Ark., and headquarters at Texarkana, Tex., has been granted a permit to do business in Texas. The company is capitalized at $5,500,000 and W. L. Wood, Jr., Texarkana, Texas, is state agent. This company owns and operates the local railway lines in Texarkana.

Loop Plan Favored.—The City Plan Commission has made a report to the Camden, N. J., Common Council, favoring a loop plan of trolley service to be provided by the Public Service Railway in Camden and the Philadelphia Rapid Transit Company for the new Delaware River bridge. Cars from Philadelphia will cover the principal streets of Camden from the bridge plaza. The plans also touch transfer points.

Financial and Corporate

Arguments Rendered on Disclosing Disposition of Funds

The Minnesota State Supreme Court has under advisement the case of the appeal by the Twin City Rapid Transit Company from an order of the Hennepin County District Court for the company to disclose disposition of $227,000 deposited in Eastern banks. The city had obtained a writ of mandamus for the disclosure.

In arguments before the high court attorneys for the company and the city differed widely as to the scope of the new Brooks-Coleman act under which determination of street car rates is placed in the jurisdiction of the State Railroad & Warehouse Commission, based on valuations. Judge David Simpson, of counsel for the company, says the law does not give the city officials power to compel corporations to disclose business transactions not germane to valuation hearings. City Attorney Neil M. Cronin argued if the company can refuse to submit to particular transactions it can refuse to explain any expenditure, having designated that it is immaterial, and he held without this information the accurate cost of operation cannot be reached.

The city had also required a list of stockholders of the Twin City Lines, which also was refused. Judge Simpson said that it was not within the province of the city attorney to examine personal records of the company which have no material and relative effect on rate valuation proceedings, and that the matter of names and addresses of stockholders is not relative to the subject. The city attorney read extracts tending to show that a commission or Council can order submission of all records, books and accounts of the company.

Line Purchased

The Maumee Valley Railway of Perrysburg, Ohio, has been purchased by Lawrence G. Van Ness and B. A. Webster, general manager and auditor respectively of the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad. Messrs. Van Ness and Webster purchased the traction line from the bondholders who recently acquired it at receivership sale. Perrysburg is a small municipality located on the outskirts of Toledo. The Maumee Valley Railway covers an area of 24 square miles. The traction company operates on 12 miles of its own tracks and 12 miles on the roadway of the Community Traction Company of Toledo.

Mr. Van Ness said that several northern Ohioans also are interested in the proposition with him and Mr. Webster. The new owners will begin at once to rehabilitate the line. Seven one-man type cars already have been ordered from the Cincinnati Car Company. They will replace a like number of old-style heavy-truck cars.

Mr. Webster will be in charge of the traction line under the direction of Mr. Van Ness, who has been elected president of the company. S. E. Howard, for many years connected with the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad, will succeed Mr. Webster as auditor of that railway.

Income of $4,261 for Chicago Elevated

The collateral trust report of the Chicago Elevated Railways for the year ended Dec. 31, 1921, shows a deficit after deductions of $1,149,215. The gross income amounted to $199,007.

The combined income account of the Metropolitan West Side Elevated Railway, Northwestern Elevated Railroad, South Side Elevated Railroad and Chicago & Oak Park Elevated Railroad for the year ended June 30, 1922, is as follows:

Gross operating revenue		$17,629,020
Operating expenses:		
Maintenance of way and structures	$2,128,879	
Maintenance of car equipment	1,625,728	
Power	1,669,920	
Conducting transportation	7,173,322	
Traffic	21,811	
General and miscellaneous	926,353	
Total operating expenses		13,546,015
Net operating revenue		$4,083,005
Taxes, city comp. and other items		1,316,707
Operating income		$2,766,298
Non-operating income		147,321
Gross income		$2,913,619
Deductions:		
Rentals	$412,949	
Interest	2,475,591	
Miscel. debits	20,816	
Total interest and rentals		2,909,358
Net income		$4,261

The net income of $4,261 is considerably smaller than it was for the year ended June 30, 1921, when $102,016 was realized, and for the year ended June, 1920, when there was a surplus of $97,817.

Former Order Set Aside

Judge Killits in the Federal Court at Toledo has set aside a former order entered Oct. 18, 1921, under which the Indiana, Columbus & Eastern Traction Company was authorized to abandon its line between Lima and Defiance.

The city of Lima recently asked to be made a party to the suit and pleaded that the order would relieve the company of obligations it assumed when it was granted a franchise some years ago and which has several years yet to run. The order had been concurred in by the Ohio Public Utilities Commission. Service was to have been discontinued on Dec. 31, 1922.

November Shows Deficit in Toledo

Notwithstanding that the average number of passengers carried daily increased during the month of November the Community Traction Company, Toledo, Ohio, showed a deficit from operations amounting to $2,602, being the first time a draft has been made upon the stabilizing fund since August, 1921.

Commissioner Wilfred E. Cann told the members of the board of control at their meeting on Dec. 15 that it would be his policy to build up the lines and service rather than attempt to arrive at any lower fares. His efforts to cut fares through the adoption of one-man car operations and other economies were flatly nullified by the City Council, which controls service.

Lee Camp, business agent of the street railway men, in letters to other cities has taken full credit to his organization for introducing in the Council the legislation which knocked out the one-man cars.

In line with the new policy, Mr. Cann has permitted the company to increase allowances for depreciation and to build up the maintenance and repair fund in an effort to decrease failures from mechanical and track defects. The larger depreciation fund next summer will permit considerable work to be done in rehabilitating the property, securing extensions, and rerouting lines.

The net result in November was largely influenced by heavy drafts made for accidents, extra maintenance and the winter fuel bill. In anticipation of winter weather track maintenance expenditures were increased 0.65 cent per car-mile. There was an increase of 0.628 cent per car-mile in the cost of transportation, which is due to heavy payments made for coal for heating the cars. Increased expenditures for injuries and damages of 0.469 cent per car-mile reflect the clearing of many old claims and an abnormal increase in the claims from automobile collisions.

Of all claims paid 41.4 per cent of the money went for automobile accidents, for which the commissioner thinks a new traffic ordinance will provide some remedy.

The sinking fund now totals $391,299.

Mr. Cann plans to have a maintenance fund of $640,000 for the coming year to keep the tracks and cars in excellent operating condition.

Operations for the first half of December have shown the best patronage since the cost-of-service plan was put into effect nearly two years ago. One week day in that period showed more than 200,000 revenue passengers compared with the average of 165,000 throughout the month of November. December is running about $25,000 in gross revenue ahead of November based upon present returns.

Expresses Hope for Future of Property

At the recent annual meeting of the Duluth-Superior Traction Company, Duluth, Minn., President Robertson expressed the hope that the affairs of the company had passed the critical stage and that when the investigation now under way had ended the company would be permitted to earn a reasonable return and render the kind of service the people were entitled to.

It was brought out that the increased fare in the city of Duluth had improved the company's revenue since Aug. 1. Cumulative preferred stock dividends at the rate of 4 per cent per annum for the quarters ending June 30 and Sept. 30, 1921, were paid Oct. 2, 1922, and at a meeting of the directors held on Nov. 20 preferred stock dividends of 1 per cent for each of the quarters ending Dec. 31, 1921; March 31, 1922, and June 30, 1922, were declared payable Jan. 2, 1923, to stockholders of record Dec. 15, 1922.

Surplus of $1,355,303 in Eleven Months

During the first eleven months of 1922 the Virginia Railway & Power Company, operating in Richmond, Petersburg, Portsmouth and Norfolk, lost in gross earnings 7.75 per cent in comparison with the same period in 1921. During the same period the company cut operating expenses 19.06 per cent under the figures of 1921 for the first eleven months, and recorded increases in net earnings, and surplus of 18.71 and 64.14 per cent, respectively.

During the above-mentioned period the gross earnings of the system were $8,576,642 compared with $9,296,909. Operating expenses were $5,271,814 for this period in 1922, and $6,512,916 in 1921.

Net earnings from operation are listed at $3,304,832 compared with $2,783,993, an increase of $520,839 during this period. The company's other income, derived from rents, etc., is listed at $123,811. Taxes were $2,073,340, a slight decrease. The surplus listed by the company in its eleven months statement is $1,355,303 compared with $825,674 for eleven months last year, an increase of $529,629.

These figures are for the entire system. The company operates besides its electric railroads in these four cities the lighting plants in Richmond and Petersburg.

New England Investment Declares Dividend

The New England Investment & Security Company, Springfield, Mass., has announced a dividend of $2 a share payable on Jan. 2, 1923, to holders of the preferred shares of record on Dec. 20, 1922. Other properties of the New England Investment & Security Company declaring dividends include the Springfield Railway Companies, the Springfield Street Railway Company and the Worcester Consolidated Street Railway. The Springfield Railway Companies have declared a dividend of $2 per share payable on Jan. 2, 1923, to preferred shareholders of record on Dec. 20, 1922. A 3 per cent dividend on the capital stock of the Springfield Street Railway is payable on Jan. 2 to stockholders of record on Dec. 20, 1922. A $2.50 dividend per share on the first preferred stock of the Worcester Consolidated Street Railway is declared payable on Dec. 30 to stockholders of record on Dec. 20, 1922.

November Net Income Decreases

The Department of Street Railways, Detroit, Mich., for the thirty days ended November, 1922, realized a total operating revenue of $1,593,120. Of this amount $1,499,984 was revenue from transportation. The total revenue is less than it was for the thirty-one days in October, when it amounted to $1,614,010. Total operating expenses decreased from $1,127,370 for the October period to $1,107,092 in November. There was a decrease in the net income of $5,291 under the October figure. Traffic showed a considerable falling off in the month of November. During October there were 37,752,445 passengers carried against 37,103,301 passengers in November, 1922. November, 1922, car-miles operated totaled 3,799,880, against 3,890,517 in October, 1922.

$64,857 in Excess Over Operation Cost

A decrease of $24,267 is noted in the total receipts of the Boston (Mass.) Elevated Railway for the five months ended Nov. 30, 1922, compared with the five months period of 1921. The figures are $13,158,502 and $13,182,769 respectively. However, the total cost of service for the 1922 period was $162,738 less than it was for the five months period of 1921. This produced an excess of receipts over cost of service for the 1922 period of $64,857. For the same period in 1921 the result was an excess of cost of service over receipts amounting to $73,613. There was an increase in the total number of revenue passengers, 135,918,976 being transported during the five months ended Nov. 30, 1921, and 145,166,757 for the same period this year.

Automobile Equipment of Public Service to Be Taken Over by Production Company

The Public Service Production Company on Jan. 1, 1923, will take over the maintenance of the automobile equipment of the Public Service Corporation of New Jersey and its subsidiaries and this will include the construction of automobile bodies.

The Public Service Production Company was incorporated in the interests of the Public Service Corporation of New Jersey in February, 1922. It was explained at that time that the purpose of the Public Service Corporation was to broaden its field of usefulness and that the new company would be an engineering organization. It is separate from the so-called operating companies, the Public Service Electric Company, the Public Service Railway and the Public Service Gas Company, which confine their work to operation.

The charter of the production company is extremely broad with respect to the activities in which the company may engage. It has its office at the Public Service Terminal, 80 Park Place, Newark, N. J. N. A. Carle is vice-president and general manager and E. B. Meyer is chief engineer of the company.

Conspectus of Indexes for Dec., 1922

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population.

Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen and conductors on 105 street and interurban railways in the United States, operating more than 100 passenger cars each, and weighted according to number of cars.

Seeks to Purchase Electric Properties

The Cumberland County Power & Light Company, Portland, Me., has filed a petition with the Public Utilities Commission seeking permission to buy the properties of the York County Power Company and the Westbrook Electric Company.

For the past ten years both companies have been operated by the Cumberland County Power & Light Company, which owns the common stock of both. With but slight changes in the boards of directors the officers of all three companies are the same, and the territory controlled by them represents a continuous lighting and power system all operated under the direction of the Cumberland County Power & Light Company.

The three companies have an aggregate capitalization of $10,700,000, and this will be in no way affected by the sale.

Coincidentally with the filing of the petition by the Cumberland County Power & Light Company, a petition was filed by each company to sell to the Cumberland County Power & Light Company.

The capital stock of the Cumberland County Power & Light Company is given in its petition as $10,000,000 with a bonded indebtedness of $4,218,000, and net earnings for the past year of $621,367.

Securities Sold at Auction

Electric railway securities sold by Adrian H. Muller & Company on Dec. 6 at the Public Auction Room, 14 Vesey Street, New York, were as follows:

Fifty shares Louisville & Southern Indiana Traction Company, $25 lot.

One hundred and twenty-five shares Indianapolis & Louisville Traction Company, $50 lot.

Three shares Milford & Uxbridge Street Railway Company common, $2 per share.

$55,000 Boise & Interurban Railway first mortgage 5 per cent gold bonds, due April 4, 1946, 45 per cent and interest.

$11,000 Ohio River Electric Railway & Power Company first 5 per cent, July, 1924, January, 1919, coupons on, 10 per cent

$17,000 New York & North Shore Traction Company first mortgage 40-year 5 per cent bonds, certificate of deposit, $40 lot.

Three hundred and ninety shares New York & North Shore Traction Company, $4 lot.

New Companies to Seek Shore Line Rights

Three petitions for consideration of the General Assembly were received on Dec. 14 at the office of the Secretary of State to do with the efforts of trolley interests to acquire the right to again operate the defunct Shore Line Electric Railway from New London, Conn., to New Haven, Conn.

The East Lyme Traction Company, East Lyme, and the Eastern Connecticut Railway, Norwich, seek authority to buy sections of the present lines of the company. The East Lyme Traction Company wants to secure control of the Shore Line road from its junction with the tracks of the Connecticut Company, at Montauk Avenue and Bank Street, in New London, through the towns of New London and Waterford to Keeney's corner.

The Eastern Connecticut Railway seeks permission to change its name to the Norwich & Hallville Railway and to purchase that section of the Shore Line road from Norwich to Preston, Conn. In another petition, Robert W. Perkins, Charles B. Whittlesey and Edward M. Day, who are the petitioners representing the two mentioned companies, also seek a charter and franchise to operate the Shore Line road from New Haven to Old Saybrook, Conn.

Cash Dividends to Be Paid

A dividend of 6 per cent on the outstanding preferred stock of the Virginia Railway & Power Company, Richmond, Va., was recently declared by the directors, 3 per cent of which is payable on Jan. 20 and 3 per cent on July 20, both to stock of record on Dec. 31. The company declared dividends payable in preferred stock in January of this year and last year. This is the first cash dividend paid on these shares since the middle of 1919. No dividends have been paid on the common stock since 1918.

Financial News Notes

Net Income Increases.—The report of Beaver Valley Traction Company, New Brighton, Pa., shows gross of $525,867 for ten months ended Oct. 31, 1922, a decrease of $31,359. The net after taxes was $132,565, which is an increase of $74,646.

Valuation Reduced.—There has been a reduction of more than $1,000,000 in the valuation of the St. Joseph (Mo.) Railway, Light, Heat & Power Company by the state board of equalization. An announcement to this effect was recently made at St. Joseph.

Preferred Stock for Sale.—A syndicate headed by Stone & Webster is offering $3,800,000 of 7 per cent preferred stock of the Central Indiana Power Company. The price is 90 and accrued dividends to yield about 7.78 per cent. The proceeds will be used for extensions and improvements.

Wants to Sell Stock.—The recently incorporated Alabama Traction Company, which is now operating the old North Alabama company's lines in Albany and Decatur, has applied to the Public Service Commission for permission to sell stock. The sale of the Alabama Traction Company was referred to in the *Electric Railway Journal*, issue of Dec. 2.

Authorizes Purchase.—The Missouri Public Service Commission at Jefferson City, Mo., has granted permission to the St. Joseph Electric Railway, Light, Heat & Power Company to purchase all of the property of the Savannah (Mo.) Electric Light & Power Company. It includes all the distributing system and lines of the Savannah company. The price was reported as $40,000.

Balance of Bonds Offered. — The $250,000 balance of an authorized issue of $1,500,000 of 7 per cent general mortgage bonds of Nova Scotia Tramways & Power Company, due in thirty years, is now being offered by J. C. Mackintosh & Company of Halifax. They are for sale at par to yield 7 per cent. The major portion of the issue was offered last spring. The bonds constitute a specific charge on all the assets of the company subject to the first mortgage issue of $2,250,000 now outstanding and due in 1946. Management of the company is in the hands of Stone & Webster, of Boston.

Will Pay Dividend.—For the first time since 1917, the New York State Railways, operating lines in Rochester, Syracuse, Utica, Rome and interurban lines, will pay a dividend on Jan. 2 of 1½ per cent on the common stock, 10 per cent on account of accumulated dividends on the preferred stock and 1¾ per cent on preferred stock to holders of record on Dec. 22. The New York State Railway has $19,952,000 in common stock outstanding, of which $13,604,300 is owned by the New York Central Railroad. The outstanding 5 per cent cumulative preferred stock amounts to $3,862,500. The dividend will mean a distribution of $733,817.

November Receipts Show Increase.—Receipts of the Cincinnati (Ohio) Traction Company for the month of November show an increase of $24,646 over the same month last year. The November receipts this year were $671,813. Last year in November the fare dropped from 8 to 7½ cents and this monthly report offered the first opportunity for comparison between 1922 and 1921. The showing of the traction company during November is regarded as particularly good in view of the fact that motor buses, which have developed their business during the past six or seven months, have cut the traction company receipts by about $500 a day, according to William J. Kuertz, Director of Street Railways.

Eleven Months Net Equals $1,850,259.—The net income of the Philadelphia (Pa.) Rapid Transit Company for the eleven months ended Nov. 30, 1922, was $1,850,259, against $1,447,394 for the same period in 1921. There was an increase in the number of passengers carried and in the passenger revenue. From January-November, 1922, 772,975,336 passengers were carried, compared with 763,216,214 for the same period in 1921. The passenger revenue increased from $37,786,322 for the eleven months ended November, 1921, to $37,937,833 for the eleven months ended November, 1922. Capital betterments and extensions for 1922 will approximate $2,000,000. As in former years, it is said that they will be financed largely from the renewal reserve.

Traffic and Transportation

Ordinance Passed

City Council of Seattle Approves Five-Cent Fare Bill—Increased Patronage Essential for Permanency

Five-cent carfare on the Seattle (Wash.) Municipal Railway lines, with a charge of 1¼ cents for transfers, effective March 1, has been assured by the passage of a fare reduction ordinance by unanimous vote of the City Council and signature of Mayor E. J. Brown. The ordinance represents the views of Mayor Brown in every particular, who urged that the reduction be postponed until March 1 of next year. The measure as passed did not meet with the approval of all members of the City Council, several of whom favored free transfers, but the vote was unanimous nevertheless. Street car fare reduction in Seattle has been a public issue for more than a year, and the bill just passed is an amended form of a measure introduced last June in the Council.

The new fare provides the following: Fare for single continuous ride, without transfer privilege, 5 cents; for single continuous ride with transfer privilege, 7 cents cash, or 5 cents cash and one 1¼-cent token; children going to or from school, cash fare, 3 cents; for two children, 5 cents; children under 15 years of age, going to or from Sunday school, same rates as for week day school; children under 5 years of age, accompanied by parent or guardian, free; passengers whose ride originates on following "feeder lines" will be furnished a transfer to or from a connecting main line on the payment of 5 cents cash: North Fortieth Street, Youngstown shuttle, Madison and James Street cables, and Ray Street line; transfer to the Seattle & Rainier Valley line will be issued only on payment of 10-cent cash fare; rate of fare upon that portion of the Highland Park and Lake Burien Railway line operated by the city outside the city limits will be 10 cents, in addition to the fare charged on said line within the city limits; metal tokens will sell at the rate of four for 5 cents, each token being good for transfer to intercity lines in connection with a 5-cent cash fare; the 8⅓-cent tokens now in use will be redeemed in cash or accepted for fare with transfer privileges.

When the new low fare goes into effect, city officials state that increased patronage will be absolutely essential if the system is to be operated permanently under such a fare. George F. Russell, superintendent of public utilities, has officially reported to Mayor Brown that there must be an increase of 46 per cent in car riding to make the railway pay with a 5-cent fare. Figures compiled by Supt. Russell show that during the first ten months of the present year the average number of pay passengers carried monthly was 7,995,902. In order to make the system meet all rates, the average monthly pay rides must be increased to 11,746,465, the accountants report. The average monthly receipts for the first ten months of 1922, according to Supt. Russell, was $516,002. Figured on the basis of the present number of daily car rides, the new rates will provide $328,626 a month. Operating expenses, including the depreciation charge together with the monthly apportionment of bond interest and principal, averaged $528,103 a month for the first ten months of the year.

Weekly Pass to Supplement Zone Fares

San Diego Electric Railway Announces Welcome New Year's Gift to the Public

Following a survey made by Walter Jackson, the San Diego (Calif.) Electric Railway has decided to usher in the new year with the unlimited-ride, transferable weekly pass in five varieties.

The principal pass, sold at $1, will be good in both the inner and outer fare zones of San Diego. The basic fare in San Diego is 5 cents, while the two-zone rider has the privilege of buying a monthly, bearer type commutation book averaging a 6⅔-cent fare; a 7½-cent token, bought four for 30 cents, or 10 cents straight cash. The weekly pass is simply an additional, optional rate. It is expected to prove exceptionally popular with two-zone riders, as they are then likely to enjoy less than a 5-cent fare for wholesale use and also be freed of all change, token, receipt and transfer transactions.

Three other passes will be sold at $1.25 a week for the suburban routes to Coronado, Ocean Beach and National City. The Coronado pass covers a combination of San Diego car-ferry-Coronado car. Its use will relieve Coronado riders from the present practice of tendering three fare tickets in each direction. The fifth pass, to sell for $2, is for the more remote community of Chula Vista, in the heart of the lemon country. All these suburban passes are supplemental to existing cash, round-trip and commutation rates.

Mr. Jackson is now in San Diego to work up the necessary publicity in co-operation with Claus Spreckels, general manager, and E. J. Burns, assistant general manager of the San Diego Electric Railway. The installation of the passes was purposely delayed to Jan. 1, 1923, so that the publicity with press, business interests, theaters, platform men and general public could be carried out more effectively after the Christmas rush was over. It is an interesting coincidence that the San Diego zone system also went into effect on New Year's, namely, Jan. 1, 1920.

Conferences Next Step in Traffic Problem

Conferences between members of the special traffic committee that evolved the one-way traffic plan now under consideration and engineers and officials of the Portland Railway, Light & Power Company, Portland, Ore., will be the next step in the movement to solve the traffic problem in the congested district of Portland. This course was determined after I. F. Fuller, vice-president of the traction company, had pledged co-operation on the part of his company to the city in meeting the traffic problem. Mr. Fuller made it plain, however, that his company was not inclined to expend between $200,000 and $250,000 in rerouting of street cars, if relief could be gained without this outlay. He also informed the Council that one-way traffic for street cars was not practicable on north and south streets, but could be worked out on east and west streets.

Mr. Fuller, in a recent hearing on the subject, explained that his company carried about 250,000 passengers each day. He also called attention to the fact that the company was running about the same number of cars that were operated in 1913, and for that reason the street cars had not contributed materially to the traffic problem that now demands solution. He stated that one-half of the 60-ft. streets and one-third of the 80-ft. streets are lost to use of traffic because of the parking of automobiles on both sides of such streets.

Mr. Fuller stated that on east and west streets it would be mainly a question of how best to bring about one-way traffic. He recommended that establishment of non-parking zones during the rush hours, provision for loading zones and one-way traffic on all streets that are not double-tracked for street cars would solve the traffic congestion and at the same time mean no outlay of large sums of money. He expressed the company's entire willingness to co-operate with the city officials in the working out of a practical and economical plan for solving the congestion problem.

Hark to the Commandments of the Boston Elevated

The Boston Elevated Railway has recently published a safety bulletin for its employees. It contains various suggestions, and among others the following "ten commandments for railroad men."

> Carelessness often means death. Don't be careless.
> Look both ways.
> Don't just leave it to the other fellow.
> Know your brakes.
> Keep your mind on your work.
> Always be in position, for "death" attacks from all directions and angles.
> Keep your car under control at all times.
> Don't take chances. Always know.
> Never race with death; you can't beat him.
> Keep safety first in your mind at all times, and when in doubt say it to yourself.

The bulletin concludes with the slogan adopted for safety work by the company: "Any accident may be fatal."

Complains of High Charges

Upon petition filed by Hugo Kelley, secretary to Mayor E. J. Brown of Seattle, Wash., and forty-six others, the Department of Public Works at Olympia will immediately file a complaint challenging the reasonableness of the rates and tariffs of the Seattle & Rainier Valley Railway. The petition states that in view of the reduction in fares proposed on the Seattle Municipal Railway the fares of the Rainier Valley line will be exorbitant unless also reduced. The petition sets forth that the purchase price of the city lines is being paid out of fares, while the Rainier line, which runs from the center of the city to Renton, a suburb, has no such charge on its revenue. Hearing on the complaint will be held as soon as the department's engineering and accounting forces can prepare data and secure facts.

Bus Operation Decreases Railway Traffic

Decrease in traffic of the Columbus, Newark & Zanesville and the Indiana, Columbus & Eastern traction lines in 1922 over that of 1921 is ascribed to bus competition in a report filed Dec. 23 in the office of F. A. Healy, secretary-treasurer of the lines in Springfield, Ohio. The report showed a decrease of approximately 8.2 per cent for the Indiana, Columbus & Eastern and about 11.9 per cent for the Columbus, Newark & Zanesville lines.

Mr. Healy said that four bus lines, all of them operating since May 1, parallel the Columbus, Newark & Zanesville line, and it was to this fact that the company attributed the heavier decrease in traffic on that road. He estimated that by the first of the year the two roads would have lost $250,000, the greater portion because of bus competition, although automobile traffic in the summer season is another factor that serves to cut down revenue.

Buses to Accommodate West Springfield Residents

Owing to a protracted delay on the part of the Springfield, Mass., City Council in legislating in relation to a street car route leading to the new Hampden County Memorial Bridge, Clark V. Wood, president of the Springfield Street Railway, has consented to put on buses to run across the bridge for the accommodation of West Springfield residents. Negotiations between Mr. Wood and the respective municipal authorities on either side of the river are expected to be taken up within a few days in respect to the details of such an arrangement. It is not settled as to whether such a bus line would carry the free transfer provision. The Springfield City Council's transportation committee was favorable to granting an independent bus line a franchise to run over the bridge. The West Springfield selectmen were not disposed to accede to this arrangement, but it is understood that sentiment was shifting toward that solution in case no other means was open to establish an early service of some sort across the bridge and so shorten the distance from that involved by the present route over the North End Bridge. President Wood has signified his willingness to apply for a franchise to lay tracks through Vernon Street to the bridge immediately upon a vote of the City Council to widen Vernon Street.

Provincial Government Passes Regulatory Act on Fares

Provision for the appointment of temporary commissions to fix passenger fares of the British Columbia Electric Railway was made by the Legislature of British Columbia by an act passed on Dec. 15. The act was entitled the British Columbia Electric Railway passenger rates act.

This takes the place to some extent of the former public utilities act which was abolished two years ago, but is limited in its scope to the company mentioned and to railway service. One of the reasons why the former commission was discontinued was the cost to the government. The new scheme provides for the cost, including the remuneration of commissioners, secretaries and so forth, to be assessed upon one or other of the parties.

In fixing rates, the commissions are required to give the company a fair and reasonable return on the value of the property of the company. Appraisals of property may be made, the costs being imposed upon the company.

The commissions are to be appointed by orders-in-council on application either of some municipality traversed by the company's lines, the company itself or not less than 100 voters residing in a locality without municipal organization.

The company operates in nearly a score of cities and municipalities and fares have been charged on temporary agreements, modifying the existing franchises. The new act continues all existing fares until changed, but its powers are to be invoked, it is stated, only in case municipalities and the company cannot come to mutually satisfactory agreements. The city of Vancouver recently passed a new franchise by which both parties agreed not to use the provisions of the act.

Will Extend One-Man Car Service

The Morris County Traction Company, Morristown, N. J., will install an automatic block signal system on its lines which run from Lake Hopatcong to Maplewood and Elizabeth. The company will extend the use of one-man cars. They are now being run from Summit to Elizabeth, Wharton to Rockaway and Danville to Boonton. All two-men cars now in use will be remodeled. Employees of the company are protesting the installation of the one-man system and have appeared before the Board of Aldermen of the city of Denver.

Transportation News Notes

Seeks Fare Adjustment.—The Muskogee (Okla.) Traction Company has made application to the Oklahoma Corporation Commission for an adjustment of street car fares in that city. The company is now operating under an 8-cent fare, with two tickets for 15 cents. The company wants the 8-cent fare for single rides continued, but would sell tickets in blocks of five for 35 cents.

Buses Ordered.—A. N. Broadhead, president of the Jamestown, (N. Y.) Street Railway, has ordered three passenger motor buses to be placed in operation on the south side of the city. Some time ago the Jamestown Common Council granted the company's request for permission to try out motor bus service in that section of the city. The buses will be placed in operation early in January as a feeder for the Jamestown traction lines.

City Attorney Seeks Lower Fare.—The city attorney of Oklahoma City, Okla., has filed a petition with the commission requesting a decrease in fares on the lines of the Oklahoma Railways. John W. Shartel, president of the railway company, declined to give any comment other than that he considered the agitation over a 5-cent fare at this time unwise. He is expected to file his answer shortly with the State Corporation Commission.

Make Change in the Street.—In order to expedite the loading of cars in the evening rush hours, the Springfield (Mass.) Street Railway has adopted the system of making change in the street for passengers, uniformed employees being stationed for that purpose at busy corners between 4:30 and 6 o'clock in the afternoon. This was done at the suggestion of the Police Commission. Whether the arrangement will be permanent or not will depend on results. The object is more particularly to speed the departure of pay-as-you-enter cars, and passengers are said to have responded to it to a gratifying extent.

Second Class Rates Cut.—The Pacific Northwest Traction Company, Olympia, Wash., recently filed a tariff with the Department of Public Works establishing second class rates applicable to articles of food and drink and lowering first class rates on shipments of 50 lb. or more on its lines between Seattle and Bellingham, effective Dec. 15. The second class rates to be established are practically 20 per cent lower than the reduced first class rates announced. They apply between Bellingham and Everett, and all intermediate points, and between Seattle and all points north of Everett, including Maryhill, Silvana, Burlington, Sedro Woolley, Milltown and Conway.

Personal Mention

Mr. Murphy Manager

Engineer in Charge of Electrical, Mechanical and Roadway Departments Succeeds Mr. Reynolds

Ernest A. Murphy, assistant general manager of the United Traction Company, Albany, N. Y., in charge of electrical, mechanical and roadway departments, has been appointed general manager of the company to succeed Albert E. Reynolds, resigned. Mr. Murphy was formerly superintendent of equipment of the company. To this position he was appointed in 1917 and continued in it until Dec. 31, 1921, when he was made assistant general manager.

The story goes, if memory does not wander, that none other than Abraham Lincoln said he did little reading of biographies because biographies so seldom reflected the facts of the flesh and blood individual. Too often the biographer fits his subject to a preconceived picture instead of drawing the picture himself. As a matter of fact, critics of biographical volumes have in their reviews often done a better service to readers than the authors themselves have done to their subjects. Again, if memory does not play false, Macaulay's essay on the Earl of Chatham's biography was a notable example of the critic outwriting the creator. It would be interesting to tell the whole story about Mr. Murphy at this time, but here it is necessarily a case of *pars pro toto*, presenting a part of the whole.

E. A. MURPHY

Picture in your mind's eye, then, a young man graduating from the Manchester Institute in England with the degree of electrical and mechanical engineer, determined to succeed at his chosen profession and seeking America as the battle ground on which he would carve out his career. Then picture the same young man going from shop to shop and job to job and company to company ever learning, ever advancing, ever improving and you have a good portrait of young Murphy. He is an engineer with the instincts of a business man. There is a directness about him that to some might seem disconcerting, but it is merely the outward manifestation of the inward man. Mr. Murphy never hesitates. He is never likely to get lost. He is sure of himself but not satisfied with that individual. This is a distinction with a great difference.

Mr. Murphy has done some very big things up at Albany in the shops and at the same time has worked numerous small economies which in the aggregate are a startling total. It has been the good fortune of the *Electric Railway Journal* to describe some of this work in the past. But the fact must not be overlooked that biography, to many, is still a matter of dates and places and positoins. For them is the following:

Mr. Murphy began his railway career with the London Metropolitan Railway and figured prominently in the electrification of the London Tramways. His first position in this country was with the Chicago Elevated Railroad, where he specialized in automatic train control and installed that system on the elevated trains. This work completed, Mr. Murphy became a member of the engineering staff of the Illinois Traction System and later assisted in equipping the Pittsburgh, Harmony, Butler & Newcastle Railway, Pittsburgh, Pa. Mr. Murphy was appointed general superintendent of the electric department of the Interborough Rapid Transit Company, New York, in 1913, from which position he went to Albany as head of the equipment department of the United Traction Company.

Mr. Ham Elected President of Safety Council

William F. Ham, president of the Washington Railway & Electric Company, Washington, D. C., has been elected president of the Washington Safety Council, the permanent safety body of the District of Columbia. John J. Boobar has been elected vice-president, A. E. Seymour, secretary, and John Poole, treasurer. These officers will serve until the first annual meeting in February, when permanent officers will be elected and the organization perfected. Following his election. Mr. Ham said he would do his utmost to make the permanent safety drive a success. The safety instructions in the schools, Mr. Ham said, would be continued as they had proved valuable.

The council pledged itself to a continuous campaign for safety. One of the important features of the by-laws is the provision for a traffic committee which is to make a survey of all traffic conditions and submit reports proposing any changes deemed advisable.

Membership in the council will be open to any corporation, association, partnership or individual. These memberships will be divided into three classes, namely, individual, sustaining and contributing.

New Roadmaster in B.R.T. Track Division

Frederick L. Finch has been appointed roadmaster in the surface track division of the Brooklyn (N. Y.) Rapid Transit Company. He brings to his new position a broad experience gained in various track jobs he has held in both the East and West. In 1903 he became superintendent of track and roadway with the Mahoning & Shenango Railway & Light Company at Youngstown, Ohio. After serving for seven years in that capacity he went to Spokane, Wash., as superintendent of track with the Washington Water Power Company, which operates an electric railway. After three years he returned East to become general roadmaster for the International Railway with headquarters in Buffalo, N. Y. He resigned from this position to go to the Brooklyn Rapid Transit Company to work under P. Ney Wilson, the superintendent of surface roadway. Mr. Finch's father was a railroad contractor in Pittsburgh and built street railroads in various parts of the East. His father was his first employer.

F. L. FINCH

Mr. Jackson Joins N.E.L.A.

Carl D. Jackson, a member and former chairman of the Wisconsin Railroad Commission, has resigned from the commission, effective Dec. 31, 1922. Mr. Jackson will become an attorney for the National Electric Light Association and the American Gas Association. His position as commissioner pays $5,000 a year, and a number of the Wisconsin Railroad Brotherhood officials have been mentioned as possible successors. City Attorney Niven of Milwaukee has asked Gov. John J. Blaine to appoint to the position a Milwaukee man who could represent on the commission the interests of this, the largest city in Wisconsin. The term of Henry Trumbower, another railroad commissioner, will expire in February.

Another Important Post for Mr. Loring

Former Trustee of Eastern Massachusetts Street Railway Called to Office by Governor Cox

Homer Loring, former chairman of the trustees of the Eastern Massachusetts Street Railway, Boston, Mass., has been made chairman of the State Commission on Administration and Finance by Governor Cox of Massachusetts. This is one of the most responsible posts that the Governor has had to fill and the selection is another tribute to Mr. Loring's sterling worth as an administrator. By virtue of his position on the commission Mr. Loring will be the new budget commissioner for the state.

Mr. Loring goes about his work quietly. He had long been president of the Fort Dodge, Des Moines & Southern Railway and prominent as a director of a score of other corporations before anything was known about him publicly outside of the immediate circle in which he moved. But when the need arose Mr. Loring was found out in the open battling for the preservation of the things he was convinced were sound.

Perhaps the first thing that he did to attract the attention of the public to him was to foster in 1918 the campaign in behalf of the holders of the securities of Massachusetts electric railways. As chairman of the Association of Massachusetts Street Railway Security Owners he directed a successful educational campaign on behalf of the street railways of the state in 1918. In this connection it is generally conceded that the association's activities were chiefly responsible for securing the passage of remedial legislation during 1918.

Largely on account of his activities in this connection Mr. Loring was induced to address the members of the American Electric Railway Association in conference in New York on Nov. 1, 1918. Even then Homer Loring was merely a name among the rank and file of electric railway operators outside of New England. At that time he said that no one claimed the new legislation giving state aid to the railways was perfect, but that all agreed that it rescued the Boston Elevated from receivership and "that it will enable the Bay State Street Railway, with 900 miles of track, to be successfully. reorganized."

Perhaps the legislation passed by the state did enable the Bay State Street Railway to be successfully reorganized as the Eastern Massachusetts Street Railway, but the opinion prevails down Boston way that Mr. Loring as chairman of the public trustees had a great deal to do with making the reorganization successful and that he accelerated the process. At the petty salary of $5,000 a year Mr. Loring worked over the remains of this railway until he had revitalized them. Then Mr. Loring withdrew. His work as trustee of the Eastern Massachusetts Street Railway was in the nature of a public service, but he now enters upon an even larger public service.

It is a distinct loss that men like Homer Loring are so seldom elected to public office or accept appointment when urged to do so. In the light of events since Mr. Loring appeared before the members of the American Electric Railway Association as a speaker the advice he gave at that time appears now to have been prophetic, namely: (1) Be frank with the public; lay all the cards on the table. (2) Do not try to defend inflated capital; you cannot successfully do so in these modern days. (3) If public control is demanded, insist upon a definite guarantee of interest return. (4) Give special attention to systematic public education and if possible organize your security owners for this task.

Mr. Harrsen Joins Electric Bond & Share Forces

H. P. Harrsen has resigned as assistant general manager of the Michigan Railroad and the Michigan United Railway to join the staff of the Electric Bond & Share Company, New York, N. Y., attached to the foreign department. Here there will be a greater opportunity than has existed in Michigan for the application of the broad experience and the peculiar talents of Mr. Harrsen. Until he took up his present post with the companies in Michigan three years ago a great deal of Mr. Harrsen's time had been devoted to the management of public utility properties in foreign lands. He has had experience in all phases of public utility work, including operation, supervision of construction and the securing of franchises from municipal, state and federal authorities. In addition to English he is thoroughly conversant with Spanish and German and has a fair working knowledge of French.

Mr. Harrsen was born in St. Louis in 1876. He was graduated from St. Louis public schools and for two years was a student at the Undergraduate Department, Washington University, St. Louis. He then had two years shop practice with the Emerson Electric Manufacturing Company, St. Louis, and served two years as station operator of the Aguascalientes Electric Light Company at Aguascalientes, Mexico. Then for two years he was private secretary to the president and general manager of the Mexico Tramways. Next came a service of six years with the Toledo Railways & Light Company, then known as the Toledo Traction Company, in the following positions: carhouse inspector, dispatcher, chief dispatcher, division superintendent, then superintendent. For eight years Mr. Harrsen was associated with Dr. F. S. Pearson in Mexico, first as general superintendent of the Mexico Tramway Company, then general manager and finally managing director of the Mexico Tramway and the Mexican Light & Power Company. Then followed a service of four years as managing director of the Barcelona Traction Company at Barcelona, Spain, in charge of the operation of the interurban system out of that city as well as the power company. As assistant general manager of the Michigan Railroad for the last three and one-half years in charge of operating the system, the civil engineer, electrical engineer, traffic manager, superintendent of equipment, master mechanics and superintendents reported directly to Mr. Harrsen.

W. M. Vandersluis has been appointed electrical engineer for the Chicago electrification and terminal improvements of the Illinois Central Railroad, succeeding Hugh Pattison. Mr. Vandersluis was formerly signal engineer of the Illinois Central Railroad, and later secretary of the commission appointed by the railroad to decide upon the system of electrification.

Raymond A. Masters has been appointed division superintendent of the Halsey division of the Brooklyn (N. Y.) City Railroad effective Dec. 15. Mr. Masters has been in the schedule department of the company since January, 1920. Prior to that he was connected with the Michigan Railroad as train dispatcher on the Western division. He also served with the Union Traction Company of Indiana and with the so-called Ben Hur line.

L. J. Smith, assistant engineer of the Pacific Electric Railway, Los Angeles, Calif., and in charge of supervision of track bonding and welding since the year 1918, resigned on Nov. 1, 1922. He accepted the position of Western district sales manager in handling transformer sales and representative of the Packard Electric Company of Warren, Ohio. Mr. Smith in his new position also is Western representative for the Ideal Electric & Manufacturing Company of Mansfield, Ohio.

Raymond S. Price has been appointed assistant division superintendent of the central division of the Public Service Railway, Newark, N. J. Mr. Price started with the Public Service as conductor in New Brunswick in 1911. He then became chief dispatcher of the Public Service Railroad with headquarters at Port Reading. In 1919 he was made assistant superintendent of the railroad, which he held until his recent promotion. Mr. Price will be stationed at Elizabeth, where Philip F. Maguire is division superintendent.

John J. Hubbard, assistant secretary of the Public Service Commission of New York, has resigned and will engage in private practice as an expert accountant and financial adviser to public utilities. He will make his headquarters in New York City. Mr. Hubbard has been connected with the commission in various capacities for ten years. One of his important jobs was expert accountant and chief of the division of capitalization. During his service in this branch the commission approved the issuance of more than $800,000,000 of public utility securities.

BUSINESS ANNOUNCEMENTS

Business Review of 1922

Major Movements in Business Shown by Statistics Compiled by Department of Commerce — Some Surprising Changes Shown in Production and Consumption Figures

AT THIS time of the year it is customary for business to pause long enough to take account of the progress made during the twelve months just elapsed, and from this standpoint to make some conjectures as to the coming months of the new year. It is with a feeling of satisfaction that most industries can view the progress of the past year in spite of the many difficulties which have been experienced. At the close of 1922 there are no serious obstacles in sight which should hinder further advances during the early part of the new year. The unsettled conditions in foreign countries, particularly in Europe, are still depressing domestic trade, and to a certain extent have, no doubt, kept the prices of agricultural products below the level of other commodities. Within the past two months this latter condition has, in a measure, been relieved.

Production of manufactured commodities in 1922 was about 50 per cent greater than in 1921, according to figures compiled by the Department of Commerce from latest reports to the Bureau of the Census made in connection with the "Survey of Current Business." Textile mills were about 20 per cent more active than in 1921, the iron and steel industry increased its output from 60 to 70 per cent over 1921, nonferrous metals from 50 to 95 per cent, petroleum 15 per cent, coke 40 per cent, paper 20 to 30 per cent, rubber 40 per cent, automobiles 50 per cent, building construction 50 per cent, lumber 35 per cent, brick 50 per cent, cement 15 per cent, leather 20 per cent, sugar 45 per cent, and meats about 5 per cent. Agricultural receipts were in general higher than in 1921.

The increase in production and the reduction in immigration improved the labor situation from a large surplus of labor at the end of 1921 to a point where shortages occur, while unemployment has almost been eliminated.

Transportation conditions changed from a huge surplus of idle freight cars to a considerable shortage, while car loadings were 11 per cent greater than in 1921.

Prices to the farmer increased about 17 per cent during the year, wholesale prices advanced 10 per cent and retail food prices declined 5 per cent. This condition gives the farmer a greater purchasing power and narrows the margin between wholesaler and retailer.

The volume of trade was considerably heavier than in 1921. Sales of mail order houses increased 6 per cent and chain stores show a gain of 13 per cent. Debits and bank clearings also show about this same relation.

The iron and steel industry was from 60 to 70 per cent more active than in 1921 but about 25 per cent less active than in the boom year of 1920. Iron ore movement was 65 per cent greater than in 1921, pig iron production increased 60 per cent and steel ingot production 71 per cent. Unfilled orders of the United States Steel Corporation rose about 60 per cent during the year. Iron and steel prices rose from 15 to 50 per cent, with the highest relative increase in pig iron. Exports of iron and steel, based on ten months' figures, declined 26 per cent.

EQUIPMENT AND ALLIED INDUSTRIES DO LARGE BUSINESS

Locomotive shipments by manufacturers for the first eleven months of 1922 were 16 per cent less than in 1921, owing to the decline of shipments for foreign account of 56 per cent. Domestic shipments increased 8 per cent. Unfilled orders for foreign locomotives on Dec. 1 were less than a year ago, but domestic orders were over ten times as large. Orders for freight cars placed in eleven months of 1922 were over seven times as large as a year ago.

Production of steel sheets averaged about 75 per cent of capacity in 1922 as against 35 per cent in 1921. Sales of fabricated structural steel were about 88 per cent larger in 1922 than in 1921, based on eleven months' figures.

Copper production showed an increase of 36 per cent over eleven months of 1921, but was almost 30 per cent below the 1920 figures. Exports of copper were 29 per cent greater than in 1921, on the basis of ten months' figures. The price of copper advanced about 10 per cent during the year.

In spite of the strike, bituminous coal production was only 7 per cent less than in 1921 for the eleven months' period, a decrease of 26,000,000 tons. Anthracite coal, however, showed a decline of 47 per cent, with a loss of 40,000,000 tons. Production of beehive coke increased 32 per cent and by-product coke production increased 41 per cent. Public utility electric power showed an increase of 7 per cent on a ten months' basis.

The average surplus of 282,926 freight cars on Dec. 1, 1921, has almost disappeared, and in its place the average shortage has increased from almost nothing to 133,786 cars. The number of cars in bad order has been considerably reduced during the year. Total car loadings for 1922 increased about 11 per cent over 1921, in spite of the drop in car loadings, and were almost up to the high mark of 1920. Railroad revenues declined 2 per cent from 1921 on a ten months' basis, due to a decrease of 1 per cent in freight revenue and 9 per cent in passenger revenue. Operating expenses were reduced by 6 per cent, resulting in a gain of 23 per cent in net operating income.

Wholesale prices have made a gradual rise in 1922 and the index number of the Department of Labor is 10 per cent greater than a year ago. Farm products and metals had the greatest relative gains. The index numbers of *Dun's* and *Bradstreet's* showed larger increases during the year, the former rising 13 per cent and the latter 21 per cent.

The total United States interest-bearing debt was reduced by $667,000,000 during the twelve months ending Dec. 1, or about 3 per cent: Liberty and Victory loans were reduced by $2,153,000,000, or about 11 per cent. Customs receipts increased 46 per cent and were far greater than in any previous year. Total ordinary receipts of the government declined 24 per cent and disbursements were reduced by 30 per cent, with a balance of ordinary receipts of over $300,000,000 in eleven months. Per capita money circulation declined slightly during the year.

The number of business failures was 27 per cent larger than in 1921 and exceeds any previous year since 1915. The amount of defaulted liabilities exceeded the huge defaults in 1921 by 5 per cent.

Security prices rose considerably during the year, industrial stocks averaging an increase of about 34 per cent, railroad stocks about 17 per cent and bonds about 20 per cent. Stock sales were 55 per cent greater than in the 1921 period and bond sales increased 26 per cent; Liberty-Victory bond sales declined 18 per cent, but other bonds increased in volume by 92 per cent.

The general index of foreign exchange compiled by the Federal Reserve Board increased about 10 per cent during the year and now stands at 67 per cent of par. The principal changes during the year were the increases in the pound sterling, the Canadian dollar, and the Argentine, Dutch and Swedish exchanges, and the continued rapid fall in German marks.

Exports were about 16 per cent less than in the eleven months' period of 1921 and the lowest in value since 1915. Imports up to the time the new tariff law went into effect were above the 1921 corresponding period by approximately 16 per cent. Imports of gold declined 62 per cent and exports increased 57 per cent, but an export balance of $215,000,000 still remained for the eleven months of 1922.

Market for Steel Ties Unusually Brisk

Prospects as to the use of steel ties by the electric railways in 1923 are brighter than for several years past. While the largest bookings and orders have usually come in February, a large number of orders have already been placed during December for delivery before March 15. Early orders are said to be due to some extent to the fact that present prices are based on steel in stock and on order which was bought at $8 to $10 per ton under the present prices.

Manufacturers of steel ties are desirous of holding present prices, but will probably be forced to follow the steel market to its present level of $2 per 100 lb., Pittsburgh. It is hardly anticipated, however, that any advance beyond this is in immediate prospect because of the fact that the large production and bookings of the mills in December, which were at a 40,000,000 rate, caused no flurry in either corporation or independent prices.

Metal, Coal and Material Prices

Metals—New York	Dec. 26, 1922
Copper, electrolytic, cents per lb.	14.75
Copper wire base, cents per lb.	16.50
Lead, cents per lb.	7.25
Zinc, cents per lb.	7.27
Tin, Straits, cents per lb.	38.875
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$8.625
Somerset mine run, Boston, net tons	4.425
Pittsburgh mine run, Pittsburgh, net tons	3.125
Franklin, Ill., screenings, Chicago, net tons	3.125
Central, Ill., screenings, Chicago, net tons	2.20
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No 14, per 1,000 ft.	6.50
Weatherproof wire base, N.Y., cents per lb.	16.50
Cement, Chicago net prices, without bags.	$2.20
Linseed oil (5-bbl. lots), N.Y., cents per gal.	93.00
White lead, (100-lb. keg), N.Y., cents per lb.	12.375
Turpentine, (bbl. lots), N.Y., per gal.	$1.36

Rolling Stock

Sacramento (Calif.) Northern Railroad has recently closed a contract with the General Electric Company covering the purchase of two 60-ton steel locomotives. They are designed for both 600- and 1,500-volt operation and with arrangement for operation on either third rail or trolley. These locomotives are equipped with four General Electric 251-600/1,500-volt motors which have a nominal one-hour rating of 200 hp. each. At the hourly rating of the motors the locomotives will have a tractive effort of 21,000 lb. and a speed of 18.3 m.p.h. when operating on 1,500-volt trolley. General dimensions of the locomotives are as follows:

Length inside of knuckles	37 ft. 4 in.
Length of cab	32 ft. 7 in.
Height of cab	11 ft. 11⅝ in.
Height with trolley down	12 ft. 11 in.
Width over all	9 ft. 7⅛ in.
Total wheelbase	25 ft. 5 in.
Rigid wheelbase	7 ft. 2 in.
Track gage	4 ft. 8½ in.
Minimum radius of curvature	50 ft. locomotive alone

Weights are approximately as follows:

Electrical equipment	39,400 lb.
Air brake and compressor	4,600 lb.
Mechanical equipment	76,000 lb.
Total weight	120,000 lb.
Weight per driving axle	30,000 lb.

Chicago Surface Lines has just placed orders for 100 motor passenger cars of the same type as the sixty-nine that are now under construction in its shops for hauling trailers. J. G. Brill Company will furnish seventy bodies and all the trucks and the remaining thirty bodies will be built by the McGuire-Cummings Company. Each car will be equipped with four G. E. 275 motors.

Track and Roadway

Brooklyn (N. Y.) Rapid Transit Company has purchased 600 International steel ties for use in reconstructing track.

Gary (Ind.) Street Railway, in its improvements for 1923, plans the construction of 8 miles of additional track, an extension of the line east on Fifth Avenue to the new tube mills and a line to the new Gary-Miller Municipal bathing beach. Officials state that the cost of laying the stretch of track to the beach will cost in the neighborhood of $500,000. Construction for both tracks will be started in the spring and an effort will be made to have them completed by the middle of next summer.

Power Houses, Shops and Buildings

Concord (N. H.) Electric Railways plans the immediate rebuilding of its power plant in West Concord, recently damaged to a great extent by fire.

Oklahoma Union Railway, Tulsa, Okla., will erect a brick and tile freight building at Sapulpa, according to an announcement by officials of the road. A site for a future passenger station will be provided near the freight depot.

Cincinnati & Dayton Traction Company, Hamilton, Ohio, had its Cincinnati terminus damaged by fire recently to the extent of $3,000. The storeroom containing records of the traction company was destroyed. There were a score or more passengerrs in the station when the fire was discovered.

New York (N. Y.) Transit Commission has ordered the reconstruction of the local station of the Interborough Rapid Transit Company at Thirty-third Street and Fourth Avenue into an express station. The commission also authorized the lengthening of all platforms at the local stations on the east side subway between Brooklyn Bridge and Grand Central Station. It is estimated that these rebuilding and reconstructing jobs will cost $4,000,000.

Jamestown, Westfield & Northwestern Railroad, Jamestown, N. Y., one of the traction lines controlled by the Broadhead interests of Jamestown, will build a new freight terminal in Jamestown to handle more efficiently the rapidly increasing freight traffic throughout Chautauqua County and southwestern New York. Two acres of property have been purchased and it is proposed to construct two freight and express sheds, each 300 ft. long and 18 ft. wide.

Trade Notes

Chicago Surface Lines has ordered 250 Johnson hand-operated fare boxes. These are in addition to the 270 that are already installed.

United Electric Railways, Providence, R. I., has purchased 900 of a new type of Rooke register from the Rooke Automatic Register Company which will take nickels, dimes, quarters and metal tokens. The railway has standardized on this type of fare collecting device and is using it on all its cars, both pay-enter and pay-leave, as well as on the open summer cars. They are also used on one-man cars, on interurban cars where fairly sizable through fares are picked up on the first collection, and on motor buses. Delivery on the new registers will begin Jan. 2.

Johnson Fare Box Company, Chicago, Ill., has sold to Lloyd E. Work & Company of that city $250,000 of first mortgage 6½ per cent sinking fund gold bonds, secured by pledge of the Ravenswood plant. The proceeds of the issue will be used by the Johnson company to provide additional working capital needed in carrying out contracts into which it has recently entered and to retire an issue of serial bonds and take care of floating indebtedness. The company reports 32,000 of its boxes in use, with the demand constantly growing and the outlook bright for sales in the foreign fields. Among the prominent cities in which the Johnson box is now in use are New York, Brooklyn, Washington, Baltimore, St. Louis, Memphis, Grand Rapids, Minneapolis, St. Paul, Omaha, Denver, Los Angeles, San Diego and cities in which Stone & Webster operate.

New Advertising Literature

Elliott Service Company, New York, N. Y., through its public safety department, has recently issued four posters on safety. They are designed for display in street cars, garages and gasoline service stations and other suitable places and are intended particularly to caution automobilists against reckless driving. They show collisions between automobiles and trolley cars caused by the carelessness of the automobile driver.

International Steel Tie Company, Cleveland, Ohio, with an attractive Christmas greeting card, has issued a pamphlet entitled "Tracks Built on Concrete Base." This little book gives the message for better trade in 1923. The booklet contains some fourteen pages and is a reprint of an article which appeared in the *Electric Railway Journal* by A. E. Harvey, superintendent of way and structures of the Kansas City (Mo.) Railways. The article was entitled "Tracks Built on Concrete Base in Kansas City." Some general views of the work as it was carried on in Kansas City are shown in the pamphlet.

THIS BOOK IS DUE ON THE LAST DATE
STAMPED BELOW

AN INITIAL FINE OF 25 CENTS WILL BE ASSESSED FOR FAILURE TO RETURN THIS BOOK ON THE DATE DUE. THE PENALTY WILL INCREASE TO 50 CENTS ON THE FOURTH DAY AND TO $1.00 ON THE SEVENTH DAY OVERDUE.
